FORM 10-K

FOR ANNUAL AND TRANSITION REPORTS
PURSUANT TO SECTION 13 OR 15(d) OF THE
SECURITIES EXCHANGE ACT OF 1934

(Mark One)

ANNUAL REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the fiscal year ended December 31, 2007

OR

TRANSITION REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the transition period from to .

Commission file number 000-51410

CRYOCOR, INC.

(Exact Name of Registrant as Specified in its Charter)

Delaware
(State of Incorporation)

33-0922667
(I.R.S. Employer

Identification No.)

9717 Pacific Heights Boulevard

San Diego, California 92121

(Address of Principal Executive Offices, including Zip Code)

(858) 909-2200

(Registrant's Telephone Number, Including Area Code)

Securities registered pursuant to Section 12(b) of the Act:

<u>Title of Each Class</u>	<u>Name of Each Exchange on Which Registered</u>
Common Stock, \$0.001 par value	The Nasdaq Stock Market

Securities registered pursuant to Section 12(g) of the Act:

None.

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. YES NO

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. YES NO

Indicate by check mark whether the registrant: (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding twelve months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days. YES NO

Indicate by check mark if disclosure of delinquent filers pursuant to Item 405 of Regulation S-K is not contained herein, and will not be contained, to the best of registrant's knowledge, in definitive proxy or information statements incorporated by reference in Part III of this Form 10-K or any amendment to this Form 10-K.

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer or a smaller reporting company. See definition of "large accelerated filer", "accelerated filer" and "smaller reporting company" in Rule 12b-2 of the Exchange Act.

Edgar Filing: CRYOCOR INC - Form 10-K

Large accelerated filer Accelerated filer Non-accelerated filer Smaller reporting company
Indicate by check mark whether the registrant is a shell company (as defined in Exchange Act Rule 12b-2). YES NO

The aggregate market value of the registrant's voting and nonvoting common stock held by non-affiliates of the registrant was \$39,027,886 based on the closing sales price on June 30, 2007 as reported on the Nasdaq Stock Market.

The number of shares of registrant's common stock outstanding on March 3, 2008 was 12,731,714.

DOCUMENTS INCORPORATED BY REFERENCE

Portions of the registrant's definitive Proxy Statement, or the Proxy Statement, to be filed with the Securities and Exchange Commission, or SEC, pursuant to Regulation 14A in connection with the 2008 Annual Meeting of Stockholders to be held on May 8, 2008 are incorporated by reference into Part III of this report. Such Proxy Statement will be filed with the SEC within 120 days after the registrant's fiscal year ended December 31, 2007.

PART I

The statements in this Form 10-K that are not descriptions of historical facts may be forward-looking statements that are subject to risks and uncertainties. These include statements related to the timing for regulatory approval, if any, for our cryoablation system in the United States for use in treating atrial fibrillation, or AF, and whether such regulatory approval will be obtained, the timing for when we will submit an application for premarket approval, or PMA, for AF, our ability to achieve milestones under our collaboration with Boston Scientific, Inc., the advantages of our cryoablation system, our positions and likely outcomes in, and costs associated with, our litigation with CryoCath, Inc., our strategy, the timing for product sales in the United States, if any, our anticipated continuing net losses, the amount and timing of future spending to develop existing and new product candidates, and the period over which our existing cash reserves will be sufficient to fund our ongoing operations, all of which are prospective. Such statements are only predictions and reflect our expectations and assumptions as of the date of this Form 10-K based on currently available operating, financial, and competitive information. The actual events or results may differ materially from those projected in such forward-looking statements due to a number of factors, including risks involved with our ability to obtain regulatory approval in the United States for our cryoablation system for use in treating AF, risks associated with our ability to submit a PMA for AF, risks associated with our ability to obtain additional financing as necessary, risks involved with our estimates of the size, make-up and costs involved with the Company's restructuring, risks associated with our ability to ultimately receive approval from the FDA for the use of our cryoablation system to treat AF, risks associated with our ability to successfully commercialize our cryoablation system in the United States and elsewhere if our cryoablation system is approved for use in the United States, risks associated with our dependence on patents and proprietary rights, including in connection with our litigation with CryoCath, risks associated with our protection and enforcement of our patents and proprietary rights, risks associated with the development or availability of competitive products or technologies, and the other risks and uncertainties identified in the section of this Form 10-K entitled "Risk Factors" and elsewhere in this Form 10-K and in our other publicly available documents. These forward-looking statements speak only as of the date of this Form 10-K. We expressly disclaim any intent or obligation to update any of these forward-looking statements after the filing of this Form 10-K to reflect actual results, changes in our expectations, or otherwise. The following information should be read in conjunction with the consolidated financial statements and the notes thereto included in this Form 10-K.

ITEM 1. BUSINESS

As used in this report, the terms we, our, ours and us refer to CryoCor, Inc., a Delaware corporation, and its subsidiaries, unless the context suggests otherwise. We were incorporated in Delaware in August 2000.

Overview

We have developed and manufacture a minimally invasive system based on our proprietary cryoablation technology for the treatment of cardiac arrhythmias. Cardiac arrhythmias are dysfunctions in the electrical activity of the heart that normally controls and maintains the highly coordinated contractions of the heart. Arrhythmias cause the heart to pump blood less efficiently, cause potentially debilitating symptoms and can result in life threatening events such as stroke. We have focused our initial development efforts on designing a system for treating atrial fibrillation, or AF, and right atrial flutter, or AFL, the two most common and difficult to treat arrhythmias. AF is the most prevalent arrhythmia and AFL is the second most prevalent arrhythmia and can lead to, and often coexists with, AF.

In August 2007, we received approval of our application for premarket approval, or PMA, from the United States Food and Drug Administration, or FDA, for the treatment of AFL with our CryoCor Cardiac Cryoablation System, or cryoablation system. We are in the process of building our sales and marketing capabilities, and have recently hired a Vice President of Sales and Marketing and several sales representatives. Our first commercial

Table of Contents

sales of our cryoablation catheters for the treatment of AFL in the United States occurred in the fourth quarter of 2007 and we have shipped a limited number of cryoablation catheters and consoles to new commercial sites. To date, our commercial efforts have been focused on converting our clinical trial sites to begin treating commercial cases, and seeking new commercial sites that either have not used any cryoablation system, or have not used CryoCor's cryoablation system and are interested in evaluating our system. We do not expect that we will generate a significant level of revenues until we expand our installed base of consoles and we are approved for the treatment of AF, if at all. There can be no assurance that we will ever generate a significant level of revenues.

In August 2007, we completed the enrollment of our pivotal trial for the treatment of AF and believe that we are the first company to complete the enrollment of a randomized pivotal trial for the treatment of AF. In September 2007, we were invited by the FDA to present our experience to an Advisory Panel convened by the FDA to discuss the status of AF pivotal trials. During this Advisory Panel, we discussed our experience in completing enrollment of the AF pivotal trial, and certain members of the Advisory Panel noted our successful efforts in completing enrollment in the pivotal trial. We believe this Advisory Panel was an important meeting as the Advisory Panel recommended to the FDA that it maintain the existing requirement for randomized clinical trial designs, and commented on the use of different methodologies for evaluating the success of ablation therapy, based upon current clinical practice. We believe that, in addition to those specified in the clinical trial protocol, the FDA will consider these different methodologies which we will present in our analysis of our clinical trial data. Based upon the anticipated time required to follow our patients subsequent to their cryoablation treatments, we anticipate that we will file a PMA for the treatment of AF in 2008, that this PMA will be reviewed by an Advisory Panel to the FDA and that a decision from the FDA on whether or not to approve our cryoablation system for the treatment of AF will be made in 2009. There can be no assurance that the FDA will determine to approve our cryoablation system for the treatment of AF, and there can be no assurance that we will be the first company to file a PMA for the treatment of AF.

In June 2007, we signed a development and license agreement with Boston Scientific Corporation, or BSC, under which we agreed to modify our existing console to run a cryoablation balloon catheter developed by BSC. Under the terms of a second separate agreement, Boston Scientific Scimed, Inc., or BSS, made an equity investment and has made development milestone payments as we have achieved specified development milestones over the course of the collaboration. We have completed the first four milestones of the development agreement, and expect to complete our final milestone and receive the final milestone payments in the second quarter of 2008. We will receive royalties from BSC upon the commercial sales of the BSC balloon catheter and upon the sale of any consoles by BSC, if any such sales occur.

AF afflicts more than 2.3 million people in the United States, where it has been estimated to account for more than \$9 billion annually in disease-related healthcare costs including drug-based therapy. Our cryoablation system, if approved by the FDA, will address that portion of the patient population for whom drug therapy has not proven effective. Because we anticipate that our cryoablation system, if approved, is likely to be approved for use in patients for whom drug therapy has failed, we are not able to estimate the size of the potential market for our cryoablation system, and the \$9 billion currently spent annually in treating AF is not necessarily a relevant indicator of the size of our potential market. It is estimated that each year approximately 500,000 new cases of AF occur in the United States. AF is the leading cause of stroke among the elderly. People afflicted with AF are at six times greater risk of stroke and two times greater risk of death as compared to the population without AF. AFL is the second most common arrhythmia. In 2000, it was estimated that more than 200,000 new cases of AFL occur annually in the United States.

The current standard of care for treating AF is chronic drug therapy, which is costly, often ineffective and can have serious side effects. Other existing treatments for AF include surgical procedures and the off-label use of catheter-based ablation devices. We believe these procedures have failed to gain broad market adoption because they may require major surgery, can cause serious complications including death, are not approved for the treatment of AF or they lack effectiveness.

Table of Contents

Our product, the CryoCor Cardiac Cryoablation System, or cryoablation system, is designed to treat cardiac arrhythmias through the use of extreme cold, or cryoenergy, to ablate, or destroy, targeted cardiac cells. Unlike radiofrequency, or RF, and other heat-based ablation technologies, which can destroy both the targeted cardiac cells and the extracellular material that binds the cells together, cryoablation leaves the material surrounding the cardiac cells fully intact. As a result, cryoablation may reduce the occurrence and severity of complications observed with heat-based ablation technologies. Our cryoablation system utilizes our proprietary technology that allows it to generate, deliver and transfer high levels of cryoenergy enabling large lesion sizes, shorter procedure times and enhanced system versatility. We believe these advantages provide better therapeutic efficacy and give us a greater ability to treat the more complex arrhythmias, such as AF and AFL, than competing cryoablation technologies. We believe our cryoablation system eliminates or reduces many of the drawbacks and risks associated with surgical and heat-based ablation procedures.

We are currently involved in a series of complex intellectual property legal actions against CryoCath Technologies Inc., or CryoCath, our only cryoablation competitor that has a cryoablation product approved for sale in the United States. These actions include offensive patent infringement actions we have brought in district courts in Delaware and Canada, an interference proceeding requested by us and declared by the United States Patent and Trademark Office, a defensive patent infringement action filed against us in the district court of Delaware, and a complaint we have brought before the United States International Trade Commission. The initial phases of these actions will take anywhere from one to three years to conclude and will be costly for us to prosecute. There can be no assurance that we will prevail in any or all of these actions.

The Normal Heart

The human heart, which consists of four chambers, is responsible for the continuous pumping and circulation of blood throughout the body. The upper two chambers are the atria, and the lower two chambers are the ventricles. Blood returning to the heart from the body flows to the right atrium and then into the adjacent right ventricle. The right ventricle contracts and pumps blood to the lungs where blood takes up oxygen. Blood flows back to the heart from the lungs through the pulmonary veins to the left atrium and on into the adjacent left ventricle. When the left ventricle contracts, oxygenated blood is pumped to the rest of the body.

Each beat of the heart is initiated and coordinated via an electrical impulse that passes through the heart's electrical conduction system. The spread of the electrical impulse causes the muscle of the atria and ventricles to contract and pump blood. The electrical system of the heart consists of the sinoatrial, or SA, node, the atrioventricular, or AV, node and special pathways in the ventricles that conduct the electrical impulse. The SA node is the heart's natural, electrical pacemaker, responsible for initiating the impulse that sets the heart's rate and its regularity, or rhythm. The electrical impulse spreads throughout the atria, causing them to contract and pump blood into the ventricles. When the electrical impulse reaches the AV node, a signal transmission center,

Table of Contents

the AV node channels the impulse into the ventricles, causing them to contract. In a healthy resting heart, this cycle is repeated approximately 60 to 80 times per minute while the body is at rest.

Heart Rate and Rhythm Disorders

Heart rate and rhythm disorders, called cardiac arrhythmias, occur when abnormal heart tissue results in a disruption in the heart's normal electrical activation sequence that may result in inappropriate generation or conduction of electrical impulses. This abnormal electrical activity can produce a lack of coordination of the pumping of blood between chambers of the heart. Arrhythmias can be classified based on whether the heart rate is slower or faster than normal. Bradycardia describes a slower than normal heart rate. Typically, abnormal bradycardia is treated with an implanted artificial pacemaker. Tachycardia describes a fast heartbeat. Tachycardia can occur normally, such as during exercise, or as a result of a pathological disruption of the heart's electrical system, in which case it is known as an arrhythmia.

Abnormal tachycardias can be characterized in the following ways:

Supraventricular or ventricular. Supraventricular tachycardia, or SVT, is a cardiac arrhythmia in which the electrical disturbance initiates and/or perpetuates in the atria or the AV node. In ventricular tachycardia, the electrical disturbance initiates and/or perpetuates in the ventricles.

Amount of affected heart tissue. Certain arrhythmias involve a limited area or fiber tract of the heart where the electrical disturbance occurs, while more complex arrhythmias involve more heart tissue.

Disorganized or organized. Disorganized arrhythmias occur when the electrical disturbance follows an irregular and unpredictable pathway in the heart such as typical AF, while in organized arrhythmias the electrical disturbance follows a distinct pathway such as AFL.

Supraventricular Tachycardias

The most common SVTs are AF and AFL which occur with a higher incidence, or occur more frequently, and have a higher prevalence, or exist in the population to a greater extent, than simple SVTs. These more complex SVTs are more difficult to treat than other SVTs such as Atrioventricular Nodal Reentrant Tachycardia, or AVNRT and Wolff-Parkinson White syndrome, or WPW.

Patients with SVTs can experience symptoms that range from mild to severe and which include fainting, fatigue, chest pain, shortness of breath and palpitations. The complications of SVTs can be fatal. The primary risk factors for SVTs include advanced age, obesity, heart valve disease or congenital heart disease, high blood pressure, chronic pulmonary disease and diabetes. Additional risk factors may include stress, excessive use of alcohol, caffeine, illicit drugs, tobacco, diet pills as well as certain other medications.

Atrial Fibrillation AF is the most prevalent SVT. It is a very complex, disorganized, supraventricular arrhythmia typically initiated in the left atrium or specifically in and around the pulmonary veins, which are the veins that lead into the left atrium from the lungs. AF is characterized by inappropriate electrical impulses that are so rapid, at more than 300 impulses per minute, and disorganized that the atria remain in a state of quiver and cannot contract and push blood into the ventricles. In some cases, a portion of the erratic atrial electrical impulses reaches the ventricles, resulting in an irregular, rapid beating, which reduces the overall efficiency of the heart's pumping action. During an AF episode, blood can pool within the atria, increasing the risk that a blood clot may form, be carried to the brain and cause a stroke. AF causes approximately 80,000 strokes each year in the United States.

Over time, if AF is not successfully treated, the abnormal initiation of the electrical impulses can modify the heart cells such that the arrhythmia continues indefinitely. The progression of AF tends to result in the following progression of increasing frequency, duration and severity:

Paroxysmal AF. Initial condition in which the initiation of the AF episode is unpredictable and subject to spontaneous termination without medical intervention.

Table of Contents

Persistent AF. Initiating and perpetuating episode of AF that persists until terminated by drugs or electrical shock therapy.

Permanent AF. Perpetuating episode of AF that cannot be terminated by drugs or electrical shock therapy.

Atrial Flutter AFL is an organized, supraventricular arrhythmia that typically occurs in the right atrium. AFL is a disease of arrhythmia perpetuation. AFL shares some features with AF in that it causes similar symptoms and increases the risk of stroke as a result of increasing the likelihood of blood clot formation in the heart. In some cases, AFL may convert to AF, or conversely, AF can convert to AFL.

Market Overview

According to an article in the January 2005 issue of *Current Opinion in Cardiology*, there are an estimated 800,000 new cases of SVT each year in the United States. The same publication also indicates that AF and AFL together represent approximately 89% of newly diagnosed SVTs.

Atrial Fibrillation

According to the Centers for Disease Control and Prevention, or CDC, AF is the most common sustained cardiac arrhythmia and increases the risk for additional types of heart disease and stroke, both leading causes of death in the United States. As reported in the January 2005 issue of *Current Opinion in Cardiology*, each year, there are approximately 500,000 new cases of AF in the United States. Approximately 2.3 million people in the United States and six million people worldwide currently have AF, according to Medscape. The incidence of AF is expected to double over the next 20 years.

Generally, AF is a progressive disease, and a significant number of AF patients will advance from paroxysmal AF to persistent AF or permanent AF, the more serious forms of the disease. At the time of initial diagnosis, approximately 90% of AF patients are classified as paroxysmal. However, a February 1996 issue of *Archives of Internal Medicine* reported studies of various populations of AF patients that indicate, depending on the population, between 35% to 66% of the cases studied had paroxysmal AF, with the remaining patients having progressed to persistent or permanent AF.

AF becomes more prevalent with increasing age. AF afflicts approximately 2.3% of the general population over the age of 40 years, approximately 6% of the population over the age of 65 years, and approximately 10% of the population in their 80s. AF is the leading cause of stroke among the elderly. Stroke is the third leading cause of death in the United States and the leading cause of adult disability. Individuals with AF have a six-fold greater risk of stroke than the normal population.

According to a May 2003 issue of *Circulation*, the rate of hospitalization due to AF in patients over the age of 35 years increased between two and three times from 1985 to 1999. Each year, billions of dollars are spent in the United States for healthcare expenditures related to AF, including costs associated with AF-related hospitalizations, AF drug therapy and its complications, life-long clinical follow-up, and AF-related stroke.

Atrial Flutter

AFL is the second most common SVT. According to the July 2000 issue of the *Journal of the American College of Cardiology*, there are estimated to be 200,000 new cases of AFL reported each year in the United States. This journal also reports that, like AF, AFL becomes more common with age.

Table of Contents

Conventional Treatments and Their Limitations

The three primary objectives for managing patients with AF are to restore and maintain normal heart rhythm, control the heart rate, and prevent stroke. Treatment options include cardioversion, drug therapy and cardiac ablation, either individually or in combination. Each of these treatments has varying degrees of safety and effectiveness.

Cardioversion

Cardioversion is typically a hospital-based procedure performed to terminate an individual episode of sustained AF or AFL through the delivery of drugs or an external electrical shock across the chest. Drugs used to terminate an episode of AF or AFL are often ineffective and may cause life threatening ventricular arrhythmias. External electrical shocks are delivered when the patient is anesthetized or sedated. Cardioversion may be effective at terminating an individual episode of AF or AFL, but the treatment is not curative and does not prevent the initiation of future episodes.

Drug Therapy

The three primary categories of drugs used to treat the symptoms of AF and AFL and their complications or risks are heart rhythm control drugs, heart rate control drugs and blood thinners. Rhythm control drugs or anti-arrhythmics can be used to either prevent initiation or terminate perpetuation of an arrhythmia. Rhythm control drugs treat patients with AF and AFL by attempting to restore normal rhythm or prevent future episodes of the arrhythmia. Rate control drugs attempt to slow the frequency of the electrical signals that cause the ventricles to contract abnormally, thereby attempting to reduce symptoms by maintaining coordinated electrical activity between the atria and the ventricles. Blood thinners are prescribed in order to reduce the risk of blood clotting that may lead to stroke. Rhythm control drugs, rate control drugs and blood thinners are prescribed either alone or in combination to the majority of patients exhibiting the symptoms of AF or AFL.

For patients with AF or AFL, drugs are often used as life-long therapy. Amiodarone, the most widely prescribed rhythm control drug used to treat AF and AFL, has reported efficacy of 55% after five years of therapy, according to the *American Journal of Cardiology*. However, for patients with paroxysmal arrhythmias, this journal reported an efficacy of 43% after five years of therapy. According to the Medscape website, rhythm control drugs used for AF and AFL, excluding amiodarone, have efficacy estimated at 30% to 50%, respectively, at one to two years of follow-up and have a significant risk of side effects that can range from minor to life threatening. The AFFIRM study published in a December 2002 issue of the *New England Journal of Medicine* assessed the overall mortality for patients on rhythm control and rate control drugs to attempt to identify the best pharmacologic management of AF. The publication reported no significant difference in the mortality rate among individuals on the two different treatment strategies.

Although amiodarone is the most widely prescribed rhythm control drug, it has serious side effects, including lung toxicity, thyroid dysfunction, corneal opacities, liver damage and skin discoloration. Due to amiodarone's serious side effects, the FDA added a "black box" warning to its labeling, intended to notify physicians of these risks. Since December 2004, the FDA has required that patients receive a document which describes the side effects of amiodarone each time a prescription is filled. Furthermore, if the rhythm control drugs are ineffective at treating a patient, individual episodes of AF in the patient may continue to progress toward a state of permanent AF. Rate control drugs also have side effects that include reduction in blood pressure, hypoglycemia in diabetic patients, depression, sexual dysfunction and constipation.

Warfarin is the most widely prescribed oral anticoagulant, or blood thinning drug. Approximately 40% of paroxysmal AF patients receive warfarin as oral anticoagulation therapy. In order for warfarin to be used safely, a patient's blood coagulation function must be maintained within a specified therapeutic range in order to reduce the risk of blood clots or bleeding from under or over anticoagulation, respectively.

Table of Contents

Cardiac Ablation

Cardiac ablation is the process of disrupting or killing specifically targeted cardiac cells to create a lesion that blocks the origination or transmission of abnormal electrical activity. This lesion is intended to prevent the initiation or perpetuation, or both, of the abnormal electrical impulses associated with cardiac arrhythmias.

Surgical Ablation

The most effective surgical ablation technique for AF is the Cox-MAZE procedure whereby the surgeon makes patterned incisions through the atrial wall of the heart and then sews the heart tissue together to create a scar that results in an electrical maze that traps the abnormal electrical impulses. The Cox-MAZE procedure is highly-invasive and requires open heart surgery, yet is effective in over 90% of patients at preventing the initiation and perpetuation of AF, according to the February 2004 issue of *Pacing and Clinical Electrophysiology*. Notwithstanding its effectiveness, over the 13-year period ending in July 2000, the Cox-MAZE procedure was used to treat only approximately 350 patients. Dr. James Cox, the developer of the Cox-MAZE procedure believes that the procedure has never been widely adopted by surgeons because of its complexity and invasiveness. We believe that surgical ablation procedures tend to be conducted only when the surgeon is already performing an open heart procedure, such as a coronary bypass graft or a heart valve replacement or repair. Surgeons have begun to use RF, microwave, ultrasound or cryoenergy ablation devices to create lesions that resemble the surgical incisions created in traditional Cox-MAZE procedures, but in somewhat less complex surgical operations. Surgical techniques are not commonly used to treat AFL.

New techniques have recently been introduced for use in less invasive surgical procedures. These approaches still require surgery, but they access the heart through one or more small incisions in the chest to create ablation lines from the outer surface of the heart. As these procedures are still surgical in nature, they require patients to remain in the hospital for approximately six days following such procedures.

Minimally Invasive, Catheter-Based Ablation

In minimally invasive, catheter-based ablation procedures, a physician, typically an electrophysiologist, guides a catheter through a vein or artery into the heart and places the tip of the catheter on the heart tissue responsible for initiating or perpetuating the arrhythmia. The physicians use fluoroscopy, or continuous X-ray imaging, to aid in positioning the catheters. The physician then delivers energy through the catheter to create a lesion and kill the target tissue. The number of lesions required to prevent the initiation or perpetuation of the arrhythmia depends on the type of SVT and its complexity. In order to safely and effectively treat AF, we believe that a physician needs to be able to safely create multiple, selectively large, permanent lesions within the heart tissue of the left atrium. The form of the energy can be RF, laser, ultrasound, microwave, or extreme cold (cryo). The degree of safety varies between energy sources. Currently, RF energy catheter systems and cryoenergy catheter systems are the only products that have been approved by the FDA for use in minimally invasive cardiac tissue ablation.

RF Ablation

RF energy uses heat to ablate tissue cells and create lesions and is commonly used to cut tissue or coagulate blood during surgery. It is also widely used by physicians in the treatment of various conditions, including prostate cancer, incontinence and gastro-intestinal disorders. RF cardiac tissue ablation is used as the primary treatment for some arrhythmias and as a secondary treatment for more complex arrhythmias, including AF. Although RF energy can ablate the cells that cause the arrhythmia within heart tissue, it can also destroy or significantly alter the extracellular material that binds cells together to form tissue. During RF ablation procedures, physicians closely monitor the position of the catheter tip using fluoroscopy in order to attempt to ensure it does not drift and damage adjacent tissue or structures.

Table of Contents

RF ablation is generally considered to be a safe and effective treatment for the less prevalent SVTs, such as AVNRT or WPW, with efficacy rates above 90% and complication rates of less than 5%. RF ablation also is currently used as a minimally invasive technique for the treatment of AFL and is approved by the FDA for this indication. This procedure is reported to have efficacy rates of approximately 90% and complication rates of less than 5%.

The FDA has not approved RF ablation for the treatment of AF, and we believe that is a result of the risk of serious and life threatening complications, RF ablation may have difficulty obtaining broad market adoption even if approved for this indication. Two articles published in the *New England Journal of Medicine* (from September 1998 and March 2006) reported effectiveness rates of 62%-74% for the treatment of AF using RF ablation with multiple treatments. In addition, various published studies have reported serious complications, including creation of atrio-esophageal fistulas, or channels, through the atrial wall into the esophagus. Physicians have modified the techniques used when treating atrial fibrillation with RF ablation in seeking to reduce or eliminate complications. We believe that, while RF can be delivered safely in many areas of the heart during the treatment of atrial fibrillation, certain areas of the heart remain unsafe for the delivery of RF, and that cryoablation may be a safer ablation energy for those areas of the heart during the treatment of atrial fibrillation. We also believe that some physicians may elect to use a combination of RF ablation and cryoablation during their AF treatments, using RF for those areas deemed safe for heat-based ablation, and electing to use cryoablation for those areas where the physician is concerned about a potential complication. Complications associated with RF ablation primarily result from the coagulation of blood and the alteration or destruction of the extracellular material that binds cells together to form tissue. Serious complications of RF ablation for the treatment of AF include the following:

Atrio-esophageal fistulas. Due to the left atrium's position next to the esophagus, the high level of heat generated during RF ablation can result in an injury that results in the formation of fistulas through the atrial wall into the esophagus, which can cause potentially fatal excessive bleeding or infection;

Blood clots. Heat generated by the RF energy can coagulate blood into clots that can travel to the brain and result in a stroke;

Pulmonary vein stenosis. Heat applied to tissue at the pulmonary vein can cause scarring which constricts the vein, potentially leading to reduced lung function;

Excessive bleeding. Heat generated by the RF energy can perforate the heart wall and lead to fluid around the heart constricting blood flow;

Phrenic nerve damage. RF energy can cause permanent nerve damage, resulting in diminished lung function; and

Pain. Due to the electrical stimulation of heart nerve fibers by the RF energy, patients can experience pain and discomfort during the procedure if they are not adequately sedated or anesthetized.

Cryoablation

Cryoablation is the use of cryoenergy, or extreme cold, to ablate cardiac cells. Cryoablation ablates the tissue by freezing cells, which subsequently rupture and die when they thaw. Unlike RF and other heat-based ablation technologies, which can destroy both the cells and the extracellular material that binds the cells together, cryoablation leaves the material surrounding the cells fully intact. As a result, cryoablation may reduce the potential complications which have been observed with heat-based ablation technologies.

Currently, there are two FDA approved cryoablation systems for the treatment of cardiac arrhythmias. Our cryoablation system received FDA approval for the treatment of right atrial flutter, and the other cryoablation system, marketed by CryoCath Technologies Inc., a Canada-based medical device company, is indicated only for the treatment of AVNRT. There is currently no cryoablation system available that is approved by the FDA for the treatment of AF. In order to treat complex arrhythmias such as AF and AFL, we believe that a cryoablation

Table of Contents

system must have adequate power to create multiple, large, permanent lesions. The power required to create such lesions demands that a cryoablation system be able to achieve and maintain consistent extremely low temperatures across a relatively large contact area throughout the entire procedure. Prior to receiving FDA approval for the treatment of right atrial flutter, we presented our preclinical and clinical data to a panel of physicians at an FDA Advisory Panel meeting. Our preclinical data demonstrated that our product creates large, permanent lesions of similar size to the lesions created by competing RF devices approved for AFL.

We believe that our cryoablation system may provide clinical advantages in the treatment of AF and AFL. A safe and effective cryoablation procedure would reduce or eliminate a patient's dependence on chronic drug therapy, which is costly, frequently ineffective and often has serious side effects. We believe that our cryoablation system has the critical features necessary to deliver adequate power to quickly and effectively produce large, permanent lesions. Our cryoablation system uses proprietary technologies that enable our catheter tip to rapidly achieve and maintain a consistent temperature throughout an ablation procedure.

We believe the principal benefits of our cryoablation system are:

Safety. We believe that safety is one of the critical requirements for broad physician adoption of a treatment for AF. Clinical studies support our belief that cryoenergy is a safe energy source for the treatment of cardiac arrhythmias. To date, our cryoablation system has been used in approximately 55 medical centers, including approximately 30 medical centers in the United States where it has been used on approximately 500 subjects during our clinical trials, and approximately 25 medical centers in Europe, where it has been used on approximately 2,000 patients. To date, we have not received any reports of esophageal fistulas, blood clots, strokes from the cryoenergy or pulmonary vein stenoses, which are risks associated with heat-based ablation procedures. We are conducting various clinical trials to demonstrate the safety of our cryoablation system.

Acute and chronic efficacy. In August 2007, the FDA approved the marketing of our cryoablation system for the treatment of AFL, confirming that our clinical data provided reasonable assurance of the safety and effectiveness of our cryoablation system for the treatment of this disease. We believe that our cryoablation system may also provide an effective treatment for AF based on the multiple clinical studies and trials completed to date. Clinical data from two published AF studies conducted using our cryoablation system and covering 52 patients and 29 patients showed that 71% and 62% respectively of those patients reported relief from clinical symptoms of AF at follow-up intervals between six and 12 months. A third study, intended to evaluate pulmonary vein isolation alone as an ablation strategy for patients with or without atrial flutter, determined that 82% of patients with paroxysmal AF, but without AFL, reported relief from clinical symptoms of AF at an average follow-up period of 26 months. The patients with a history of AFL reported a 33% success rate with pulmonary vein isolation alone. The authors of this study suggested that those patients with a history of AFL may need additional lesions in addition to isolation of pulmonary veins to manage their AF. We believe this was an important study as we believe our cryoablation system, if approved for the treatment of AF, will be able to both isolate the pulmonary veins and create the additional lesions that may help AF patients with a history of AFL. We are conducting ongoing clinical trials to demonstrate the effectiveness of our cryoablation system.

Secure catheter tip-to-tissue adherence. The extreme cold delivered by our cryoablation system causes the tip of the catheter to adhere to the heart tissue. As a result, the catheter tip does not move from the intended lesion site during the ablation application.

Familiar physician procedure. Our cryoablation system employs catheter techniques and controls similar to those commonly used by electrophysiologists in other catheter-based procedures.

Patient comfort. Cryoablation of cardiac tissue causes little or no pain during the procedure, potentially reducing or eliminating the need to sedate the patient. Pain is commonly reported by patients during RF ablation procedures, which is an important consideration in Europe where general anesthesia or conscious sedation is typically not used during catheter-based procedures.

Table of Contents

Our Strategy

Our goal is to be a leading provider of minimally invasive, catheter-based treatments for the more complex arrhythmias, AF and AFL. The key elements of our strategy include:

Demonstrating the safety and effectiveness of our cryoablation system through our clinical trials. We believe our cryoablation system provides an effective treatment that is a safer alternative for the treatment of AF than drug therapy, surgical ablation and RF or other heat-based ablation options. Our goal is to be the first company to obtain FDA approvals for the use of cryoablation in the minimally invasive treatment of AF and AFL.

Commercializing our products through a direct sales force, a direct-to-consumer marketing effort, and third party distributors. Within the United States, if approved for AF, we intend to market our cryoablation system through a specialized direct sales force that will target medical centers that perform high volumes of cardiac RF ablation procedures. We believe that a small sales force can sufficiently service the electrophysiology market in the United States because the market is highly concentrated, with the 300 most active medical centers accounting for 80% of cardiac RF ablations. We also plan to build patient awareness and support for our cryoablation system through the use of direct-to-consumer marketing. We believe there is significant interest on the part of AF patients to seek out and support a safe and effective treatment option. Internationally, we plan to offer our products through third party distributors located in specific geographic areas. Due to our limited cash resources, we do not plan to broadly commercialize our product for the treatment of AFL until our financial condition has improved.

Leveraging the influence of opinion leaders and major medical centers to accelerate adoption and market acceptance of our cryoablation system. We intend to utilize the support of leading electrophysiologists to emphasize the merits of our cryoablation system as a treatment for AF and AFL to their peers and other members of the clinical community. We also intend to continue collaborating with leading medical centers to educate physicians about the use of our cryoablation system. We plan to use the centers to establish best practices and develop certification programs for these physicians. We also expect to support small, focused, physician-sponsored studies, such as physician preference studies and post-market analyses, to expand the clinical data available regarding the safety and effectiveness of our cryoablation system. Medical technologies are often broadly adopted first by leading United States medical centers, and then more extensively by European centers.

Expanding our product line and acquiring complementary products. We are currently developing our next generation cryoablation catheter, Quantum. We expect our Quantum catheter, once developed and if approved by the FDA, to enable physicians to perform AF cryoablation procedures in a shorter procedure time, making it a more attractive procedure for them. We may acquire complementary products and technologies.

Expanding and protecting our intellectual property position. We believe that our intellectual property position will assist us in maintaining our competitive position in cardiac cryoablation. We are involved in litigation with CryoCath, both in the United States and Canada, and are pursuing other legal actions against CryoCath. We intend to continue to focus and expand our broad portfolio of owned or licensed United States and international patents and patent applications to protect the design and use of our products, principally in the areas of cryoablation and the treatment of arrhythmias.

CryoCor Cardiac Cryoablation System

Our cryoablation system consists of our Model 2020 Console, including its CryoArm Pre-Cooler and our disposable CryoBlator catheters. We also offer introducer sheaths to facilitate catheter placement in the atria for both AF and AFL ablation procedures. Our cryoablation system's components are designed to provide simple set up and minimize procedure time. Our cryoablation system utilizes proprietary technology embedded in the console, the pre-cooler and the disposable catheters that allows it to generate, deliver and transfer high levels of cryoenergy enabling selectively large lesions and shorter procedure times. We believe these advantages provide

Table of Contents

better therapeutic efficacy and a greater ability to treat more complex arrhythmias such as AF and AFL than competing cryoablation technologies.

Our cryoablation system operates by boiling, liquid nitrous oxide in the tip of the catheter under carefully controlled conditions. This results in stable catheter tip temperatures of approximately -90° Celsius. Our cryoablation system uses a microprocessor-controlled, two-stage process to control the flow and boiling of the nitrous oxide. In the first cooling stage, gaseous nitrous oxide is delivered from the console to the pre-cooler. The pre-cooler reduces the nitrous oxide temperature to approximately -35° Celsius, converting the nitrous oxide from a gas to a liquid. After the liquid nitrous oxide is delivered to the catheter's tip, the second cooling stage occurs as the liquid nitrous oxide boils, converting back into a gas. Our console dynamically adjusts the refrigeration power to changes in heat load associated with blood flow and the tissue that is in contact with the catheter tip.

Our CryoBlator catheter is critical in controlling the nitrous oxide boiling process and provides the means for the console to accurately monitor tip pressure, a parameter vital to pressure feedback loop in our cryoablation system. The size of the catheter is designed to facilitate efficient passage of spent, gaseous nitrous oxide out of the catheter and back into the console. This feature not only maintains optimal boiling pressure but also allows for the dynamic adjustment of refrigeration power without causing excess nitrous oxide to gather at the tip of the catheter. Significantly, the ability of our cryoablation system to maintain appropriate catheter tip pressure helps to ensure patient safety. Lastly, the catheter is designed to boil nitrous oxide only at its tip so that concentrated cryoenergy is delivered directly to the targeted heart tissue.

Console and Pre-Cooler

Model 2020 Console. Our console is the command center of our cryoablation system. It is comprised of advanced control electronics, proprietary software, and refrigeration components. The console is operated through a simple user interface. A screen displays command prompts and continual updates on system performance, including catheter tip temperature during the procedure. Our console houses a primary and reserve source of nitrous oxide and the components to transport the nitrous oxide to the pre-cooler. A pre-ablation safety check to ensure the integrity of our catheter is performed before any nitrous oxide is delivered to our catheter.

CryoArm Pre-Cooler. Our CryoArm Pre-Cooler utilizes patented technology that we believe is an important innovation in the delivery of cryoenergy. This enables the catheter tip to reach and maintain extremely low temperatures. The pre-cooler is located on a movable arm attached to the console. The height of the arm can be adjusted to permit convenient location and manipulation of the catheter. The arm houses hardware that measures tip pressure and temperature in the catheter. The pre-cooler is separated from the console in order to eliminate the influence of any heat generated from the console components and places the location for the generation of chilled -35° Celsius nitrous oxide near the patient enabling the efficient delivery of nitrous oxide liquid to the tip of the catheter in a liquid state.

Disposables

CryoBlator Disposable Catheters. Our CryoBlator family of disposable catheters are 10-French, or approximately 3.3 millimeters, in diameter, providing sufficient internal dimensions in order to rapidly deliver and remove the volumes of nitrous oxide required to produce and sustain extremely low temperatures at the catheter tip. Our 10-French catheters have flow capacity that is 46% greater than that of a 9-French catheter and 400% greater than that of a 7-French catheter. We believe this greater flow capacity permits our cryoablation system to process substantially greater volumes of nitrous oxide than other competing cryoablation systems. There are six catheters in the CryoBlator family, which consists of catheters with available tip reaches of five centimeters or seven centimeters and three electrode tip sizes of 6.5 millimeters, 10 millimeters, or 15 millimeters. Two of our catheters are currently approved for the treatment of AFL and being tested in clinical trials in the United States for the treatment of AF. The reach of the various catheter tips provides the physician with the ability to manipulate the catheter effectively, taking into account individual anatomic variations. Our

Table of Contents

different catheter tip sizes enable the physician to create appropriate-sized lesions. Our catheters are similar to conventional electrophysiology catheters and include a standard handle that enables physicians to remotely manipulate the tip of the catheter through 180° and position it within the heart.

Model 3110 and 3130 Sheath Dilators. Our sheath dilators are long, plastic tubular devices that enable the catheter to enter the body and be delivered into the heart. Our sheath dilators have received 510(k) marketing clearance by the FDA and are CE marked in Europe.

Quantum Catheter

We are currently developing our next generation disposable catheter, the Quantum catheter, which we envision will enable physicians to create large lesions in both linear and curvilinear shapes, thereby reducing the total number of lesions required in an AF ablation procedure. Our Quantum catheter is being designed to permit delivery of therapeutic cryoenergy pursuant to an anatomically oriented pattern rather than relying on complex cardiac electrical activity mapping to position the catheter. We believe that this reduction in the number of lesions may reduce the average time for an AF cryoablation procedure. We also believe that Quantum may be used in AF ablation procedures combining RF and cryoablation where cryoablation is performed in regions of the heart where heat-based ablation presents an unreasonable risk. We have performed substantial research in our laboratories and have successfully completed several animal studies of the Quantum catheter. We are completing design validation testing and have begun discussions with various regulatory agencies and intend to begin clinical use by the middle of 2008.

The CryoCor Cryoablation Procedure

Our cryoablation procedure is typically performed in an electrophysiology lab and involves the following steps:

Introducing and placing the catheter. Similar to RF procedures, the physician guides a catheter into the heart under fluoroscopy, or continuous X-ray imaging, placing the tip of the catheter on the heart tissue responsible for initiating or perpetuating the arrhythmia. Physicians often use a mapping catheter, which identifies the location of abnormal electrical pathways or initiation sites, to guide the position of the cryoablation catheter.

Cryoablating the diseased heart tissue. Once the catheter is placed on the target site, the physician sets the ablation time and initiates the cooling of the catheter tip. Within seconds, the catheter tip reaches a freezing temperature and adheres to the target tissue at which time the physician can turn off the fluoroscopy. The physician continues to freeze the target site for approximately two minutes depending on the desired size of lesion.

Repositioning the catheter. After the specified time, and the creation of the desired lesion, the flow of nitrous oxide is turned off, the catheter begins to warm, releasing the tip from the lesion site. The physician then repositions the tip at the next target lesion site and repeats the procedure.

AF Cryoablation Procedure

AF is often initiated by electrical activity resulting from abnormal tissue in and around the four pulmonary veins. One ablation procedure often performed in AF patients is referred to as pulmonary vein isolation, or PVI. During PVI procedures, the catheter is guided through the right atrium, across the septum, and into the left atrium. Multiple lesions are created in the left atrium near the pulmonary veins to electrically isolate one or more of the veins from the left atrium. PVI is used to stop the initiation of AF episodes by preventing the abnormal electrical activity emanating from the pulmonary vein from reaching the atrial tissue. Some clinicians have modified the PVI approach in a procedure referred to as anatomic ablation, which was developed in part to mimic the Cox-MAZE procedure and also to avoid the complication of pulmonary vein stenosis that has been associated

Table of Contents

with RF-based PVI. This procedure is completed using ablation lesions in a fixed anatomic pattern, often using a sophisticated mapping system that shows the location of the lesions in reference to the anatomy of the heart. Both anatomic ablation and PVI techniques have been performed with our cryoablation system.

While these procedures initially required approximately eight to ten hours to complete with our cryoablation system, current clinical practice using our cryoablation system requires approximately 2.5 to four hours as a result of improvements in our technology, additional data on the time required for an effective ablation, and increased physician experience.

AFL Cryoablation Procedure

AFL is caused by a looping electrical disturbance in the right atrium. The most common form of AFL involves an electrical impulse that travels toward the center of the heart across a narrow neck of tissue between the tricuspid valve and the inferior vena cava, called an isthmus. This isthmus is a common target for AFL ablation. To treat AFL, the catheter is initially positioned in the right atrium at the far end of the isthmus and cryoenergy is delivered. The catheter is then stepped across the isthmus in short increments creating individual lesions at each point. These successive freezes create a lesion line along the isthmus to block abnormal electrical conduction, which prevents perpetuation of the arrhythmia. While this procedure initially required approximately four to six hours to complete with our cryoablation system, current clinical practice requires approximately 45 minutes to two hours as a result of improvements in our technology, additional data on the time required for an effective ablation and increased physician experience.

CryoCor's Clinical Development Program and Status

Overview

In Europe, our clinical strategy was to obtain CE Mark approval by successfully demonstrating the safety of our cryoablation system and then to collect additional effectiveness data through further clinical studies. Our CE Mark approval includes a broad cardiac arrhythmia ablation indication for the treatment of patients with AF, AFL and other SVTs. Subsequent to our approval, we limited the commercial distribution of our system to medical centers where physicians continued their use and investigation of our system. These investigations refined the cryoablation procedures and techniques, provided additional clinical experience, and aided in the evaluation of the function and reliability of our system. The results generated articles for peer-reviewed medical journals. We currently sell our cryoablation system through distributors in the United Kingdom and Italy, and our cryoablation system is used by physicians in the United Kingdom, Germany, Denmark, Belgium, the Netherlands, and Italy. We do not currently intend to sign any additional distribution agreements for the distribution of our cryoablation system in Europe.

Clinical Status in the United States

In August 2007, we received approval of our application for premarket approval, or PMA, from the United States Food and Drug Administration, or FDA, for the treatment of AFL with our CryoCor Cardiac Cryoablation System, or cryoablation system. We are in the process of building our sales and marketing capabilities, and have recently hired a Vice President of Sales and Marketing and several sales representatives. Our first commercial sales of our cryoablation catheters for the treatment of AFL in the United States occurred in the fourth quarter of 2007 and we have shipped a limited number of cryoablation catheters and consoles to new commercial sites. To date, our commercial efforts have been focused on converting our clinical trial sites to begin doing commercial cases, and seeking new commercial sites that have either never used cryoablation at all, or that have not used CryoCor's cryoablation system and are interested in evaluating our system. We do not expect that we will generate a significant level of revenues until we expand our installed base of consoles and we are approved for the treatment of AF, if at all. There can be no assurance that we will receive PMA approval for the treatment of AF or that we will ever generate a significant level of revenues.

Table of Contents

AF-02 Pivotal Trial

Our AF-02 pivotal trial is a prospective, randomized, controlled multi-center trial to evaluate the safety and effectiveness of our cryoablation system in treating AF. The primary safety endpoint as defined in the protocol is the occurrence of serious adverse events, or SAEs, during the 12-month period following the cryoablation procedure, when compared to the medical management group. The protocol also specifies a secondary safety endpoint as the occurrence of pulmonary vein, or PV, stenosis. The protocol defines the primary efficacy endpoint as the recurrence of symptomatic AF between three months and 12 months following cryoablation. There can be no assurance that the trial will be adequate to support marketing approval for this indication.

We completed enrollment of all patients in the third quarter of 2007 and we believe we are the first company to complete enrollment in a pivotal trial using a medical device for the treatment of atrial fibrillation. We are currently collecting the safety and effectiveness data that will be required for our PMA submission, and we anticipate that the majority of data will be collected by the third quarter of 2008 and that we will be able to submit our PMA. We will continue to collect data on patients even beyond our PMA submission date, as some patients may have had a second ablation treatment, or have had their initial ablation treatment after failing the drug therapy arm, and under our protocol, we will collect this information.

In September 2007, we were invited by the FDA to present our experience to an Advisory Panel convened by the FDA to discuss the status of atrial fibrillation pivotal trials. During this Advisory Panel, we discussed our experience in completing enrollment of the AF pivotal trial, and certain members of the Advisory Panel noted our successful efforts in completing enrollment in the pivotal trial. We believe this Advisory Panel was an important meeting as the Advisory Panel recommended to the FDA that it maintain the existing requirement for randomized clinical trial designs, and commented on the use of different methodologies for evaluating the success of ablation therapy, based upon current clinical practice. We believe that, in addition to those specified in the clinical trial protocol, the FDA will consider these different methodologies which we will present in our analysis of the results from our clinical trial.

We are aware of two other companies, CryoCath and Johnson & Johnson, or J&J, which are conducting pivotal trials for the treatment of AF. In Q4 2007, J&J publicly announced that they had completed the enrollment of their pivotal trial, but have not announced when they will be filing a PMA. As of February 2008, CryoCath announced they were nearing completion of their pivotal trial, which they expect to complete enrolling in the second quarter of 2008. Based on when we completed enrollment in our pivotal study, we believe we will be the first company, or one of the first companies, to file a PMA for the treatment of AF with the FDA, and we expect to file our PMA in the second half of 2008. However, there can be no assurance that the data that we collect will be sufficient for the FDA to decide to approve our PMA for the treatment of AF.

Sales and Marketing

In the United States, we have hired a small number of sales personnel to market our cryoablation system for the treatment of AFL. Due to our limited cash resources, we do not plan to broadly commercialize our product for the treatment of AFL until our financial condition has improved. Once we begin broadly commercializing our cryoablation system, we intend to focus on the segment of the 2,000 electrophysiologists currently performing the highest volume RF based cardiac tissue ablation procedures. According to Verispan, in 2001, 300 medical centers performed 80% of all cardiac ablation procedures in the United States. We believe that a focused sales force of approximately 20 professionals would service these customers and cover much of the potential market for our cryoablation system in the United States. We will begin expanding our sales force once we are closer to possibly receiving FDA approval for the treatment of AF. In support of these efforts, we intend to build patient awareness through direct-to-consumer marketing for AF and AFL. We also expect to support smaller, more focused physician-sponsored studies, such as physician preference studies and post-market analyses to expand the clinical data available regarding the safety and efficacy of our cryoablation system.

Table of Contents

Outside of the United States, we may expand our current network of distributors if we receive approval for AF. However, we do not currently intend to sign any additional distribution agreements for distribution of our cryoablation system in Europe. In 2006, we closed our German operation, CryoCor GmbH, and began selling our products exclusively through distributors. We currently sell our cryoablation system through distributors in the United Kingdom and Italy. Our current agreement with our distributors will continue until January 1, 2009 at which time it may be renewed for additional one year periods.

Competition

The medical device industry is characterized by rapidly advancing technologies, intense competition and a strong emphasis on proprietary products, designs and processes. Any products that we commercialize will be subject to intense competition. Many of our competitors have significantly greater financial resources and expertise in research and development, manufacturing, preclinical testing, conducting clinical trials, obtaining regulatory approvals and marketing approved products than we do. Smaller or early stage companies may also prove to be significant competitors, particularly through collaborative arrangements with large and established companies. These third parties compete with us in recruiting and retaining qualified engineers and management personnel, establishing clinical trial sites and patient participation in clinical trials, as well as acquiring technology and technology licenses complementary to our programs or advantageous to our business.

There are a number of companies developing or marketing medical devices for the treatment of AFL and AF that are directly competitive with our product candidates. CryoCath Technologies has developed a minimally invasive, catheter-based system that uses cryoenergy to treat cardiac arrhythmias. In the United States, CryoCath has obtained marketing approval for its catheter-based cryoablation treatment of AVNRT and 510(k) clearance for its surgical probe for soft-tissue ablation. In Europe, CryoCath has obtained the CE Mark for its catheter-based products for the treatment of supraventricular tachycardias, or SVTs. CryoCath has begun enrolling a pivotal trial in the United States for its catheter-based treatment of AF. We are not aware of any other competitors conducting clinical trials that utilize cryoenergy as their energy source for a minimally invasive catheter-based system for cardiac tissue ablation. We are currently involved in a series of complex intellectual property legal actions against CryoCath. These actions include offensive patent infringement actions we have brought in district courts in Delaware and Canada, an interference proceeding requested by us and declared by the United States Patent and Trademark Office, a defensive patent infringement action filed against us in the district court of Delaware, and a complaint we have brought before the United States International Trade Commission. The initial phases of these actions will take anywhere from one to three years to conclude and will be costly for us to prosecute. There can be no assurance that we will prevail in any or all of these actions.

St. Jude Medical has been actively investing in or acquiring companies that are developing treatments and/or diagnostic tools for AF. Acquisitions over the last several years include Epicor Medical, Irvine Biomedical, and Endocardial Solutions. Other medical device manufacturers and potential competitors include Johnson & Johnson and Boston Scientific, who have developed RF catheters that we believe are being used for the off-label treatment of AF. In addition, Johnson & Johnson is conducting a randomized trial to evaluate the safety and effectiveness of its cooled-RF catheter for the treatment of atrial fibrillation. Finally, a number of companies, including Medtronic, AtriCure, Boston Scientific and Guidant, which acquired AFx in 2004, have developed surgical probes for the treatment of AF.

There are a number of drugs that are routinely prescribed for the treatment of complex cardiac arrhythmias, and drugs are currently the primary therapy for AF. Patients who fail with one drug are typically prescribed additional drugs until the symptoms are reduced or the drugs are determined to be ineffective or inadvisable due to complications. We expect to compete with drugs to the extent they remain the treatment of choice for AF.

Due to the size of the potential market, we anticipate that competitors will continue to dedicate significant resources to developing additional drugs and competing medical devices for the treatment of AF and AFL. Successful clinical results, regulatory approval and commercialization of any of these additional drugs and competing medical devices could have a material adverse impact on our business. Our ability to compete

Table of Contents

successfully will depend on our ability to develop proprietary products that reach the market in a timely manner and are more efficacious and safer than the alternatives available for the same condition. Our cryoablation system may be rendered obsolete or uneconomical by a technological advance or an entirely different approach developed by one or more of our competitors.

Manufacturing

Our San Diego facility provides space for our console manufacturing operations, sterile products manufacturing, packaging, storage and shipping, as well as for our research and development labs and general administrative facilities. We believe that our manufacturing facilities will be sufficient to meet our manufacturing needs for the foreseeable future. If we receive approval for the treatment of AF using our cryoablation system, we may have to increase our staffing levels to provide greater manufacturing capabilities to support a commercial launch in the United States. We may never receive approval for the treatment of AF using our cryoablation system.

We believe our manufacturing operations are in compliance with regulations mandated by the FDA and the European Union. We have previously been inspected by the Food and Drug branch of the California Department of Health Services. We have been FDA-registered since March 2004 and a California-licensed medical device manufacturer since May 2001. We obtained our CE Mark in March 2002, and our facility is ISO 13485 certified. In September 2005, we were inspected by the FDA in conjunction with our PMA filing for AFL. The FDA had several findings as a result of their inspection, and we have responded to these findings, and the inspection has been completed. In connection with our CE mark approval and compliance with European quality standards, our facility was originally inspected in November 2001 and, in January 2006, was certified to be in compliance with ISO 13485.

Our sterile products, which are our CryoBlator catheters and our sheaths, are manufactured in a controlled environment in our San Diego facility that provides for protection of the products from contamination. Our catheter production group consists of six skilled employees and can produce approximately 3,250 catheters per year and our console manufacturing group can produce up to 48 consoles per year. We believe these production levels are sufficient to support our initial commercial activity, but we will have to hire additional personnel if we receive approval for the treatment of AF.

There are a number of critical components and sub-assemblies in the sterile products and the console. The vendors for these materials are qualified through stringent initial evaluation and monitoring of their performance over time. We audit our critical component manufacturers on a regular basis and at varied intervals based on the nature and complexity of the components they provide and the risks associated with the components failure.

Most of the materials and components which are used in our cryoablation system are purchased from single sources due to quality considerations, costs or constraints resulting from regulatory requirements. Agreements with certain of our suppliers can be terminated by either party upon relatively short notice. These agreements will terminate earlier in the event of a material breach by us that remains uncured. We cannot quickly establish additional or replacement suppliers for certain components or materials, largely due to the FDA approval process and the complex nature of the manufacturing processes employed by our suppliers. Production issues or capacity constraints affecting our facilities, or those of our suppliers, would affect our ability to complete our clinical trials and to bring our cryoablation system to market.

Third Party Reimbursement

Medicare, Medicaid and Other Third Party Reimbursement

Healthcare providers that purchase medical devices generally rely on third party payers, including the Medicare and Medicaid programs and private payers, such as indemnity insurers, employer group health insurance programs and managed care plans, to reimburse all or part of the cost of products. We are currently selling our cryoablation system to hospitals, medical centers and clinics that receive reimbursement from these

Table of Contents

third party payers. As a result, demand for our products is and will continue to be dependent in part on the coverage and reimbursement policies of these payers. The manner in which reimbursement is sought and obtained varies based upon the type of payer involved and the setting in which the product is furnished and utilized.

Payments from Medicare, Medicaid and other third party payers are subject to legislative and regulatory changes and are susceptible to budgetary pressures. Our customers' revenues and ability to purchase our products are therefore subject to the effect of those changes and to possible reductions in coverage or payment rates by third party payers. Any changes in the healthcare regulatory, payment or enforcement landscape relative to our customers' healthcare services has the potential to significantly affect our operations and revenues.

Medicare

Medicare is a federal program administered by the Centers for Medicare and Medicaid Services, or CMS, through fiscal intermediaries and carriers. Available to individuals age 65 or over, and certain other individuals, the Medicare program provides, among other things, healthcare benefits that cover, within prescribed limits, the major costs of most medically necessary care for such individuals, subject to certain deductibles and co-payments. There are three components to the Medicare program relevant to our business: Part A, which covers inpatient hospital services, Part B, which covers physician services, other healthcare professional services and outpatient services, and Part C, or Medicare Advantage, which is a program for managed care plans.

The Medicare program has established guidelines for the coverage and reimbursement of certain equipment, supplies and services. In general, in order to be reimbursed by Medicare, a healthcare item or service furnished to a Medicare beneficiary must be reasonable and necessary for the diagnosis or treatment of an illness or injury, or to improve the functioning of a malformed body part. The methodology for determining coverage status and the amount of Medicare reimbursement varies based upon, among other factors, the setting in which a Medicare beneficiary received healthcare items and services. Any changes in federal legislation, regulations and policy affecting Medicare coverage and reimbursement relative to our cryoablation system could have a material effect on our performance.

Inpatient Hospital Setting

A significant portion of our revenues may be derived from our customers operating inpatient hospital facilities. Acute care hospitals are generally reimbursed by Medicare for inpatient operating costs based upon prospectively determined rates. Under the Prospective Payment System, or PPS, acute care hospitals receive a predetermined payment rate based upon the Diagnosis-Related Group, or DRG, into which each Medicare beneficiary stay is assigned, regardless of the actual cost of the services provided. Certain additional or outlier payments may be made to a hospital for cases involving unusually high costs. Accordingly, acute care hospitals generally do not receive direct Medicare reimbursement under PPS for the specific costs incurred in purchasing medical equipment. Rather, reimbursement for these costs is deemed to be included within the DRG-based payments made to hospitals for the services furnished to Medicare-eligible inpatients in which the equipment is utilized. Because PPS payments are based on predetermined rates and may be less than a hospital's actual costs in furnishing care, acute care hospitals have incentives to lower their inpatient operating costs by utilizing equipment, devices and supplies, including equipment sold by us, that will reduce the length of inpatient stays, decrease labor or otherwise lower their costs.

Our product sales could be affected negatively if acute care hospitals reduce or discontinue use of our products due to insufficient reimbursement, or if other treatment options are perceived to be more profitable.

Table of Contents

Outpatient Hospital Setting

CMS implemented the hospital Outpatient Prospective Payment System, or OPSS, effective August 1, 2000. OPSS is the current payment methodology for hospital outpatient services. Services paid under the OPSS are classified into groups called Ambulatory Payment Classifications, or APCs. Services grouped within each APC generally are similar clinically and in terms of the resources they require. A payment rate is established for most APCs through the application of a conversion factor that CMS updates on an annual basis. CMS may assign a qualifying service to a new technology APC for which the payment rate is based on a cost range rather than through the application of a conversion factor. In addition, under OPSS, CMS may authorize separate payments for new categories of devices, with payment amounts varying by hospital. OPSS may cause providers of outpatient services with costs above the payment rate to incur losses on such services provided to Medicare beneficiaries.

CMS proposes, and after consideration of public comment, implements changes to OPSS and payment rates on an annual basis. The OPSS methodology determines the amount hospitals will be reimbursed for procedures performed on an outpatient basis and determines the profitability of certain procedures for the hospital and may impact hospital purchasing decisions. We cannot predict the final effect that any change in OPSS regulations, including future annual updates, will have on customers of our cryoablation system. Any such effect, however, could be negative if APC groupings become less advantageous, reimbursement allowables decline, or if the OPSS is modified in any other manner detrimental to our business.

Physician Services

Medicare payment for physician and other practitioner services is based on a fee schedule. The fee schedule payment for almost all physician/practitioner service is based on the product of the relative value units, or RVUs, assigned to the service, a conversion factor, and a geographic adjustment factor based on regional costs. The RVU consists of a work and complexity component, a practice expense component and a malpractice expense component. The more time, effort, and expense involved in providing a particular service results in a higher RVU and thus a higher payment. The fee schedule calculations are applied to most medical services outlined in the American Medical Association's Current Procedural Terminology, or CPT, and some services described by alphanumeric Healthcare Common Procedure Coding System, or HCPCS, codes. CPT codes currently exist that cover electrophysiology mapping and ablation procedures and are used by physicians to submit claims for payment for the mapping and ablation procedures using our cryoablation system.

Medicaid

The Medicaid program is a cooperative federal/state program that provides medical assistance benefits to qualifying low income and medically needy persons. State participation in Medicaid is optional, and each state is given discretion in developing and administering its own Medicaid program, subject to certain federal requirements pertaining to payment levels, eligibility criteria and minimum categories of services. The coverage, method and level of reimbursement varies from state to state and is subject to each state's budget restraints. Changes to the coverage, method or level of reimbursement for our products may affect future revenue negatively if reimbursement amounts are decreased or discontinued.

Private Payers

Many third party private payers, including indemnity insurers, employer group health insurance programs and managed care plans, presently provide coverage for the purchase of medical equipment and supplies which may include our cryoablation system. The scope of coverage and payment policies varies among third party private payers. Furthermore, many such payers are investigating or implementing methods for reducing healthcare costs, such as the establishment of capitated or prospective payment systems. Cost containment pressures have led to an increased emphasis on the use of cost-effective technologies and products by healthcare

Table of Contents

providers. Future changes in reimbursement methods and cost control strategies may limit or discontinue reimbursement for our products and could have a negative effect on revenues and results of operations.

Healthcare Fraud and Abuse

In the United States, there are federal and state anti-kickback laws that generally prohibit the payment or receipt of kickbacks, bribes or other remuneration in exchange for the referral of patients or other healthcare-related business. For example, the Federal Healthcare Programs Anti-Kickback Law prohibits anyone from, among other things, knowingly and willfully offering, paying, soliciting or receiving any bribe, kickback or other remuneration intended to induce the referral of patients for, or the purchase, order or recommendation of, healthcare products and services reimbursed by a federal healthcare program (including Medicare and Medicaid). Some states have anti-kickback laws which establish similar prohibitions, although these state laws may apply regardless of whether federal healthcare program payment is involved. If we are able to commercialize our products in the United States, anti-kickback laws will constrain our sales, marketing and promotional activities by limiting the kinds of financial arrangements we may have with physicians, medical centers, and others in a position to purchase, recommend or refer patients for our cryoablation system or other products we may develop and commercialize. Due to the breadth of some of these laws, it is possible that some of our current or future practices might be challenged under one or more of these laws. Furthermore, federal and state false claims laws prohibit anyone from presenting, or causing to be presented, claims for payment to third party payers that are false or fraudulent. For example, the federal Civil False Claims Act imposes liability on any person or entity that, among other things, knowingly presents, or causes to be presented, a false or fraudulent claim for payment by a federal healthcare program (including Medicaid and Medicare). Although medical device manufacturers like us do not typically submit claims to third party payers, some of these false claims laws can potentially be used by government enforcement officials or private qui tam relators against a manufacturer which provides incorrect coding or billing advice about its products to customers that file claims, or which engages in kickback arrangements with customers that file claims. Violations of anti-kickback and false claims laws can lead to civil and criminal penalties, including imprisonment, fines and exclusion from participation in federal healthcare programs. Any such violations could have a material adverse effect on our business, financial condition and results of operations.

Research and Development

Our research and development team consists of ten people at December 31, 2007 and focuses on product line extensions and improvements to our existing product line. We are working on enhancements to our products to shorten procedure times, increase ease-of-use, and improve patient outcomes. For example, we are developing our next-generation catheter, the Quantum catheter, with the goal of reducing cryoablation procedure times. We have historically spent a significant portion of our capital resources on research and development; we incurred \$7.4 million in 2007, \$5.8 million in 2006 and \$7.5 million in 2005, on research and development.

Intellectual Property

We are currently involved in a series of complex intellectual property legal actions against CryoCath Technologies Inc., or CryoCath, our only cryoablation competitor that has a cryoablation product approved for sale in the United States. These actions include offensive patent infringement actions we have brought in district courts in Delaware and Canada, an interference proceeding requested by us and declared by the United States Patent and Trademark Office, a defensive patent infringement action filed against us in the district court of Delaware, and a complaint we have brought before the United States International Trade Commission. The initial phases of these actions will take anywhere from one to three years to conclude and will be costly for us to prosecute. There can be no assurance that we will prevail in any or all of these actions.

Table of Contents

Our Patents

We rely on intellectual property rights for the protection of our current products and plan to rely on these rights to protect any other products that we may develop in the future. We own or have licensed a number of issued patents and pending patent applications in the United States and in foreign countries and plan to file additional patent applications on inventions that are important to our business and that we believe are patentable. We intend to aggressively pursue and defend patent protection on our proprietary technologies.

As of March 1, 2008, we held 18 United States patents and have a number of pending United States patent applications and foreign patent applications in jurisdictions such as Australia, Canada and Europe. The 18 issued United States patents we own expire between 2020 and 2025.

On August 31, 2000, we entered into a license agreement with CryoGen, Inc. (now owned by American Medical Systems, or AMS) pursuant to which CryoCor was granted an exclusive, irrevocable, worldwide, non-transferable, royalty-free, fully paid license to 21 issued United States patents, 18 foreign patents and 33 foreign patent applications for the field of cardiac and vascular ablation to treat arrhythmias. The United States patents in this portfolio expire between 2012 and 2021. Pursuant to our license agreement, we granted a license to certain modifications, improvements and enhancements to the inventions encompassed in the patents licensed to us pursuant to the agreement back to AMS. AMS is obligated to maintain, enforce and prosecute the patents licensed to us pursuant to the agreement at its own cost and we are obligated to do the same with respect to any patents resulting from modifications, improvements and enhancements to the inventions encompassed in the patents licensed to us pursuant to the agreement. Both we and AMS have continuing confidentiality obligations under the license agreement.

We own or have licensed United States patents and patent applications that relate to a number of technologies that are employed by our cryoablation system as well as technologies which could be used by us in future product innovations or by competitors attempting to design around our patents. Patents that may issue from our most recent patent applications will expire in 2025. A brief description of these technologies is included below.

Model 2020 Console

We own or have licensed patents and patent applications relating to control systems which utilize various sensor arrangements, a control system that varies refrigerant pressure to maintain efficient cooling power and catheter tip temperature, and a method of performing pre-operational checks on a cooling system for leaks or blockages. Applications have also been filed on methods for assessing ice ball formation and methods for selecting cooling and warming rates to maximize cell death.

CryoArm Pre-Cooler

We own or have licensed a number of patents and patent applications covering various pre-cooler designs and pre-cooling concepts which enable the delivery of efficient cooling power to the tip of a catheter.

CryoBlator Disposable Catheters

We have filed patent applications to cover various heat transfer element designs, methods for selecting capillary tube design dimensions to enhance cryocatheter performance, and designs that enable the articulation of catheters into various shapes without compromising the refrigerant flow therein.

Model 3110 and 3130 Sheath Dilators

We have filed a patent application on a device to minimize the introduction of air into a patient during insertion of a catheter which includes a flexible sheath and an air trap. Certain patents we have under the AMS license (now American Medical Systems) also cover sheaths including heat-transfer tips.

Table of Contents

Other

We either own or have licensed additional patents or patent applications which cover technologies such as refrigerants which enable catheter tip temperatures below -90° Celsius, and the use of a balloon to position and anchor a catheter's heat transfer element. Finally, we have filed applications to cover catheters with elongated heat transfer elements and designs which enable the articulation of such catheters.

The patent position of companies like ours is generally uncertain and involves complex legal and factual questions. Our ability to maintain and solidify a proprietary position for our technology will depend on our past and future success in obtaining effective claims and enforcing those claims once granted. We do not know whether any of our pending patent applications will result in the issuance of patents or whether the rights granted under any issued patents that we own or have licensed will provide us with proprietary protection or competitive advantages against competitors with similar technology.

In 2004, we requested that the USPTO institute interference proceedings between two patents owned by CryoCath Technologies and two of our CryoGen-licensed applications relating to certain primary and pre-cooling refrigeration system designs. In January 2008, the USPTO determined that one of our applications claimed rights to the same technology claimed by CryoCath, and declared an interference in which we were named the senior party. The purpose of the interference proceedings is to determine which company was the first to invent, and therefore has the rights to, the interfering subject matter. As the senior party, we are the presumed inventor of the technology and the burden of proof is placed on CryoCath to demonstrate an earlier date of invention. We believe we have an earlier date of invention, however, if we are not successful in these proceedings, we could fail to gain rights to certain patent claims.

In October 2007, CryoCath asserted a number of their patents covering both catheter and console technologies against us in the District Court of Delaware. We anticipate that this action will take between two and three years to resolve and that it will be costly for us to defend our position. We believe that the development and marketing of our cryoablation system for the treatment of AFL and AF does not infringe any valid and enforceable claim of the asserted CryoCath United States patents and, in certain circumstances, we have obtained written opinions from outside patent counsel regarding the invalidity of a number of CryoCath's patents and/or their non-infringement by our cryoablation system. There can be no assurance, however, that we will successfully defend the actions initiated by CryoCath and, if we are found to infringe any of their valid patents, it would materially harm our business.

In January 2008, we brought patent infringement actions against CryoCath, asserting a number of our CryoGen-licensed patents covering both catheter and console technologies. We initially asserted our patents in district courts in Delaware and Canada, and have subsequently asked the United States International Trade Commission, or ITC, to investigate CryoCath for illegal importation of products that infringe our intellectual property. We believe these combined actions may be an effective method of defending our intellectual property portfolio. The ITC action, in particular, is important because a successful action may block CryoCath's importation of infringing products into the United States. In 2008, in response to our action, CryoCath countersued in the District Court of Delaware, adding claims against us including infringement of an additional patent, anti-trust, and unfair competition claims. We do not believe these additional claims have merit, but we will be required to defend against this countersuit, and, if CryoCath is successful with any of these claims, it would materially harm our business.

The cost of defending and enforcing our patent rights against CryoCath has been significant, and our defensive or enforcement actions could cause us to incur significant additional costs. The time demands associated with defending or enforcing our patents rights in these actions have and will continue to interfere with our normal operations. In addition, our patents, or those licensed to us, if they are invalidated or circumvented, would not permit us to stop competitors from marketing our product, and any such invalidating or circumvention would materially harm our business.

Table of Contents

Our Trade Secrets

We rely, in some circumstances, on trade secrets to protect our technology. We seek to protect our proprietary technology and processes, in part, by confidentiality agreements with our employees, consultants, scientific advisors and other contractors, however, these agreements may be breached, and we may not have adequate remedies for any breach. In addition, our trade secrets may otherwise become known or be independently discovered by competitors. To the extent that our employees, consultants or contractors use intellectual property owned by others in their work for us, disputes may arise as to the rights in related or resulting know-how and inventions.

Our Trademarks

We have registered trademarks for the CryoCor name and logo in Europe, Japan, Australia and New Zealand. We have also applied for registered trademarks for CryoCor, the CryoCor logo and CryoBlator in the United States and Canada.

Third Party Intellectual Property Rights

The medical device industry is characterized by the existence of a large number of patents and frequent litigation based on allegations of patent infringement. Our commercial success will depend, in part, on our ability to make and sell our cryoablation system without infringing the patents or proprietary rights of third parties.

We are aware of numerous patents issued to third parties in areas of technology related to our cryoablation system. Owners and/or licensees of these patents may assert that the manufacture, use or sale of the current or future versions of our cryoablation system infringe one or more claims of their patents. Some of the patents that may pose a material litigation risk to us (in addition to CryoCath), and some of the owners of such patents, are described below. The fact that we describe certain patents and patent owners below does not mean that we consider such patents to be valid, enforceable or infringed by any of our products or product candidates or that any party having rights under one or more of such patents intends to sue us for patent infringement.

We are aware of certain United States patents owned or licensed by Johnson & Johnson or the Regents of the University of California that encompass devices and methods for treating arrhythmias using circumferential ablation. We believe that the development and marketing of our cryoablation system for the treatment of AFL and AF will not infringe any valid and enforceable claim of any of these United States patents.

We are also aware of a United States patent owned by Spemby Medical Limited which encompasses cryosurgical probe systems. We believe that the development and marketing of our cryoablation system for the treatment of AFL and AF will not infringe any valid and enforceable claim of this United States patent.

We have taken reasonable steps with respect to these and other third party patents of which we are aware to ensure that our products do not and will not infringe on the valid patent rights of others. In some instances these steps include obtaining a written opinion of patent counsel regarding the validity of such patents and/or their potential infringement by our cryoablation system. While we currently believe we have freedom to operate with respect to third party patents or other intellectual property rights of which we are aware, others may challenge our position in the future. We believe that we have meritorious defenses to any infringement suit brought against us based on the patents and other intellectual property of which we are currently aware. Nonetheless, there has been, and we believe there will continue to be, significant litigation in the medical device industry regarding patent and other intellectual property rights. The possibility of litigation filed against us based on one or more of these or other patents or other intellectual property is a significant risk. For example, because of the uncertainty inherent in any intellectual property litigation, a court may determine that current or future third party patents contain one or more claims that are valid, enforceable and infringed by our cryoablation system.

Table of Contents

There is also the risk that there may be issued patents or other intellectual property rights of which we are not aware in areas of technology related to our products. Should these intellectual property rights exist and should a third party successfully assert them against us, our business may be materially and adversely affected. Moreover, because patent applications can take many years to issue, there may be currently pending applications of which we are not yet aware and whose ultimate scope is as yet unknown which may later result in issued patents that if successfully asserted against us would materially and adversely affect our business.

Consequences of Infringement

Based on the litigious nature of the medical device industry and the fact that we may pose a competitive threat to some companies who own or control various patents, we believe that as we proceed to commercialization in the United States, there is a significant risk that one or more third parties will assert a patent infringement claim against the manufacture, use or sale of our cryoablation system. For example, in 2007 and 2008, CryoCath has asserted that we infringe a number of their United States patents, and there may be other lawsuits that have already been filed against us without our knowledge. In CryoCath's lawsuit, they are seeking to prevent us from commercializing our cryoablation system or seeking to enjoin us from selling it, and are seeking damages from us. The CryoCath litigation actions have been, and we anticipate that they will continue to be, expensive for us to defend. Investors should consider the possibility of additional patent infringement suits a significant risk. If any such patent is successfully asserted against us, it would materially and adversely affect our business.

If any of CryoCath's patents, or any patent held by a third party is ultimately determined to contain one or more valid claims that we infringe, we may, among other things, be required to:

pay actual damages, plus increased damages up to triple the actual damages and the other party's attorneys' fees, which may be substantial;

cease the development, manufacture, use and/or sale of products that infringe the patent rights of others through a court-imposed sanction called an injunction;

expend significant resources to redesign our technology so that it does not infringe others' patent rights, or to develop or acquire non-infringing technology, which may not be possible;

discontinue manufacturing or other processes incorporating infringing technology; and/or

obtain licenses to the infringed intellectual property, which may not be available to us on acceptable terms, or at all.

In addition, the CryoCath litigation has been, and any additional patent infringement litigation will be, even if the allegations are without merit, expensive, time-consuming and will divert management's attention from our core business.

If we need to redesign our products to avoid third party patents, we may suffer significant regulatory delays associated with conducting additional studies or submitting technical, manufacturing or other information related to any redesigned product and, ultimately, in obtaining approval. Further, any such redesigns may result in less effective and/or less commercially desirable products.

Additionally, we expect our ongoing legal actions against CryoCath to result in negative publicity about us or our cryoablation system, and may injure our relations with our current and prospective customers. Additionally, these actions may cause delays in commercialization or shipment of our cryoablation system.

Table of Contents

Employees and Consultants

As of December 31, 2007, we had 50 full-time employees and one part-time employee, all of whom are employed at-will. Of these employees, 10 are engaged in research and development, 11 in manufacturing, 18 in clinical, regulatory affairs and quality assurance, four in sales and marketing, and eight in administration, finance, management, information systems, corporate development and human resources. Two of our employees have a Ph.D. degree and/or an M.D. degree and are engaged in activities relating to clinical and regulatory areas and executive management. None of our employees is subject to a collective bargaining agreement. We believe our relations with our employees are good.

In February 2008, we amended our employment agreement with our Chief Medical Officer, or CMO. Our CMO is currently on a leave of absence for personal reasons, and under the amended employment agreement, she can elect to terminate her employment with us for any reason between April 30, 2008 and May 31, 2008, and will be entitled to the severance benefits provided for in her existing employment agreement. We do not know if she will elect to terminate her employment with us, however, we are making arrangements to be able to complete our regulatory and clinical objectives in the event that she elects to terminate her employment.

We have entered into an agreement with TriNet Employer Group, Inc., a professional employer organization, under which TriNet provides payroll and employee benefit services and acts as a co-employer of our employees.

Table of Contents**MANAGEMENT****Executive Officers, Directors and Other Key Employees**

The following table sets forth our current directors, executive officers and other key employees and their ages as of March 1, 2008:

Name	Age	Position(s)
<i>Executive Officers and Directors</i>		
Edward F. Brennan, Ph.D.	56	President and Chief Executive Officer and Director
Gregory J. Tibbitts	40	Vice President, Finance and Chief Financial Officer
Helen S. Barold, M.D., MPH, FACC, FHRS	42	Chief Medical Officer
David J. Cooney ⁽¹⁾⁽²⁾	38	Director
Jerry C. Griffin, M.D. ⁽¹⁾⁽³⁾	63	Director
J. Mark Hattendorf ⁽¹⁾	57	Director
Arda M. Minocherhomjee, Ph.D. ⁽²⁾	54	Director
Kurt C. Wheeler ⁽²⁾⁽³⁾	55	Director

(1) Member of the Audit Committee.

(2) Member of the Compensation Committee.

(3) Member of the Nominating and Corporate Governance Committee.

Executive Officers and Directors

Edward F. Brennan, Ph.D. has served as our Chief Operating Officer since January 2005, our President since March 2005 and our Chief Executive Officer and a member of our board of directors since March 2006. During 2004, Dr. Brennan consulted for various technology companies. From January 2001 to December 2003, Dr. Brennan was Managing Director for Perennial Ventures, a venture fund focused on early-stage investing in technology companies. From January 2000 to December 2000, Dr. Brennan served as Vice President of Tredegar Investments, a venture capital investment company. Dr. Brennan was also Executive Vice President for CardioGenesis Corp., a medical device company, from June 1995 to December 1999, where he was responsible for domestic and international clinical programs, regulatory affairs, quality systems and scientific research activities. He was the Chairman of Hemosense, Inc. until November 2007 when the company was sold to Inverness Medical Innovations. He serves on the Board of Directors of Kilroy Realty Inc., and serves or has served on the boards of a number of privately-held technology companies. He also serves on the board of trustees of the San Francisco Waldorf School. Dr. Brennan received a B.A. in Chemistry and Biology and a Ph.D. in Biology from the University of California, Santa Cruz.

Gregory J. Tibbitts has served as our Vice President, Finance and Chief Financial Officer since July 2004. From April 2000 to June 2004, he held various positions including Chief Financial Officer with Elitra Pharmaceuticals Inc., a biotechnology company. From December 1996 to March 2000, Mr. Tibbitts was a senior manager in the audit department of Ernst & Young LLP, specializing in the biotechnology, medical device and other high technology industries. He also worked with Ernst & Young LLP from September 1989 to April 1993 before joining the mortgage banking division of ITT Financial as their Controller. Mr. Tibbitts received a B.A. in Business Administration from the University of San Diego and an M.B.A. in Finance from San Diego State University. He is a Certified Public Accountant in the State of California.

Helen S. Barold, M.D., MPH, FACC, FHRS has served as our Chief Medical Officer since August 2006. From 2000 to 2002, Dr. Barold worked as a Medical Officer for the United States Food and Drug Administration, in the office of device evaluation of the Center for Devices and Radiological Health. From 2002 and until 2006, Dr. Barold practiced in cardiology and cardiac electrophysiology at the National Naval Medical Center in

Table of Contents

Bethesda, Maryland. She received her M.D. from the University of Rochester and her Masters in Public Health from Johns Hopkins University, completed her Internal Medicine residency at Johns Hopkins Hospital, and her Cardiology and Electrophysiology residency at Duke University.

David J. Cooney has been a member of our board of directors since January 2002. Since February 1997, Mr. Cooney has worked with, and is currently a Partner of, Beecken Petty O Keefe & Company, a private investment management firm focused exclusively on the healthcare industry which, together with Healthcare Equity QP Partners, L.P. and its affiliates, is one of our principal stockholders. From October 1995 to February 1997, Mr. Cooney worked in the Corporate Finance Department at Smith Barney in New York, specializing in public offerings and mergers and acquisitions for healthcare companies. Mr. Cooney serves on the boards of directors of a number of privately-held healthcare companies. He received a B.S. in History from the University of Illinois and an M.P.P. from Georgetown University with a specialization in Finance.

Jerry C. Griffin, M.D. has been a member of our board of directors since March 2001. Dr. Griffin currently is the President of Griffin & Schwartz Scientific Services Inc., a management consulting firm. From September 1999 to 2006, Dr. Griffin served as President, Chief Executive Officer and as a director of POINT Biomedical Corporation, a developer of pharmaceutical products for use with ultrasound imaging. From September 1992 to November 1998, Dr. Griffin was employed by InControl, Inc., where he served most recently as Executive Vice President and was responsible for worldwide regulatory affairs and clinical development activities. From July 1977 to August 1992, Dr. Griffin was a faculty member in the Department of Medicine, Division of Cardiology at several teaching institutions, including Professor of Medicine at the University of California at San Francisco, Assistant Professor at Baylor College of Medicine and Clinical Assistant Professor of Medicine at Stanford University. He also serves or has served on the boards of directors at one publicly held company, Scicle Pharma, Inc. and at several privately-held medical device and biotechnology companies. Dr. Griffin received a B.S. from the University of Southern Mississippi, an M.D. from the University of Mississippi.

J. Mark Hattendorf has been a member of our board of directors since July 2006. Mr. Hattendorf has over 30 years of experience in accounting, finance and business management, including as the senior financial officer for a number of publicly and privately-held companies. From April 2005 to October 2006, Mr. Hattendorf was Chief Financial Officer of EWI Holdings, a software company in San Diego. From July 2001 to April 2005, and from October 2006 to the present he has been an independent financial and business consultant advising clients on acquisitions and due diligence, negotiation strategies and financing strategies. He has experience serving on the board of directors of publicly-held and not-for-profit entities. Mr. Hattendorf began his career with KPMG's predecessor firm, Peat Marwick Mitchell & Co. He is a Certified Public Accountant and holds an undergraduate degree in Accounting and an MBA in Finance from Loyola Marymount University in Los Angeles, California.

Arda M. Minocherhomjee, Ph.D. has served as a member of our board of directors since June 2003. He is currently a partner at Chicago Growth Partners. Since 1998, he has served as a managing director of William Blair Capital Partners and prior to that was a Principal and senior healthcare analyst at William Blair & Company. He currently serves on the board of directors of Favrilite, Inc., a biopharmaceutical company, as well as several privately-held pharmaceutical and medical device companies. Dr. Minocherhomjee received a M. Sc. in Pharmacology from the University of Toronto and an M.B.A. from the University of British Columbia, and was a post-doctoral fellow in pharmacology at the University of Washington Medical School.

Kurt C. Wheeler is our Chairman and has been a member of our Board of Directors since September 2000. Mr. Wheeler is a Managing Director at Clarus Ventures LLC, a company he co-founded in 2005. Since 1999, Mr. Wheeler has been a General Partner of MPM Bioventures II-III funds. He currently serves on the board of directors of two publicly-held companies, Alsius, Inc. and Somaxon Pharmaceuticals. In addition, Mr. Wheeler serves on the boards of a number of privately held life science companies. He holds a degree from Brigham Young University and an M.B.A. from Northwestern University, where he serves on the Kellogg Alumni Advisory Board.

Availability of Reports filed with the SEC

A copy of our annual report on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to those reports filed or furnished to the SEC can be obtained free of charge at our website www.cryocor.com, or without exhibits by sending a request to our Corporate Secretary at 9717 Pacific Heights Boulevard, San Diego, CA 92121.

ITEM 1A. RISK FACTORS

Except for the historical information contained herein, this Form 10-K contains forward-looking statements that involve risks and uncertainties. Our actual results may differ materially from those discussed here. Factors that could cause or contribute to differences in our actual results include those discussed in the following section, as well as those discussed in Part II, Item 7 entitled "Management's Discussion and Analysis of Financial Condition and Results of Operations" and elsewhere throughout this Form 10-K. You should consider carefully the following risk factors, together with all of the other information included in this Form 10-K. Each of these risk factors could adversely affect our business, operating results and financial condition, as well as adversely affect the value of an investment in our common stock.

Going Concern See "Going Concern" in Note 1 of Notes to Financial Statements and page 27 of this Risk Factors section, in which we discuss the need to obtain additional financing in 2008.

We will need substantial additional funding to continue our operations and may be unable to raise capital when needed, or at all, which would force us to delay, curtail or eliminate our clinical programs or product development programs.

We will need to raise substantial additional capital to:

enforce our proprietary rights in connection with our litigation actions involving CryoCath, including the interference request we filed with the USPTO, the offensive legal actions in Delaware and Canada and the investigation pursued by the ITC;

increase our product commercialization activities in the United States;

fund our operations and clinical trials;

continue our research and development; and

defend, in litigation or otherwise, any claims that we infringe third party patents or other intellectual property rights or have otherwise engaged in anticompetitive behavior, including in connection with our litigation with CryoCath.

We believe that our cash, cash equivalents and short-term investment balances including the expected collection of the remaining \$4.0 million from the BSC collaboration will be sufficient to meet our anticipated cash requirements until the fourth quarter of 2008. However, our future funding requirements will depend on many factors, including but not limited to:

the costs of filing, prosecuting, and maintaining our owned and licensed patent applications and patents, and defending and enforcing these patents and other intellectual property rights, including in connection with our litigation with CryoCath;

the commercial acceptance of our product in the United States, including after we initiate sales efforts targeting AF, if ever;

Edgar Filing: CRYOCOR INC - Form 10-K

the costs of establishing sales, marketing and distribution capabilities;

our ability to obtain FDA approval for AF or other regulatory approvals for our products;

the scope, rate of progress and cost of our clinical trials and other research and development activities;

Table of Contents

the costs and timing of seeking regulatory approvals, including participation in FDA advisory panel meetings and performing any required additional studies or trials;

clinical trial results;

acceptance by the FDA of our clinical trial design and data to support marketing approval for the desired indications;

the extent and level of reimbursement for cryoablation for various indications;

the effect of competing products and technologies; and

the terms and timing of any collaborative, licensing and other arrangements that we may establish.

Until we can generate sufficient product revenue, which may never occur, we expect to finance our future cash needs through public or private equity offerings, debt financings or corporate collaboration and licensing arrangements. If we raise additional funds by issuing equity securities, our stockholders may experience dilution. Debt financing, if available, may involve restrictive covenants, and we may not meet the conditions required to access the additional funding under our existing credit facility. Examples of such restrictive covenants, all of which we are subject to under our current loan agreement, include limitations on our ability to incur additional debt or liens on any of our assets, dispose of our property, make dividend payments or distributions to our stockholders or enter into transactions that would result in a change in control of us. Additionally, pursuant to the terms of our current loan agreement, we are subject to a material adverse change clause, which permits the holder of the note to call the balance if a material adverse change occurs. A material adverse change is defined as, (i) a material impairment in the perfection or priority of lenders' lien in the collateral or in the value of such collateral; (ii) a material adverse change in our business, operations, or condition (financial or otherwise); or (iii) a material impairment of the prospect of repayment of any portion of the obligations. Therefore, if we become insolvent and are not able to pay our debts, our lenders have the ability to seize our remaining cash earlier than the scheduled repayment, which could force us to cease operations. The terms of any additional debt or equity financing may not be favorable to us or our stockholders. If we raise additional funds through collaboration and licensing arrangements with third parties, it may be necessary to relinquish some rights to our technologies or our product candidates or grant licenses on terms that are not favorable to us. The legal actions that we are undertaking with CryoCath are anticipated to be very expensive, and will take between one to three years to be resolved. If we are unable to raise adequate funds, we may have to liquidate some or all of our assets or delay, reduce the scope of or eliminate some or all of our clinical or product development programs or commercialization efforts, which may harm our business, financial condition, results of operations and future growth prospects.

We may not be able to continue as a going concern or fund our existing capital needs.

As more fully described in Note 1 of the Notes to Financial Statements, our independent registered public accounting firm has included an explanatory paragraph in their report on our 2007 financial statements related to the uncertainty of our ability to continue as a going concern. There is substantial doubt as to whether we will be able to continue as a going concern beyond 2008 without access to additional working capital. There can be no assurance that we will be able to obtain additional funds during 2008 on satisfactory terms, or at all. If we cannot obtain sufficient additional financing in the short-term, we may be forced to restructure or significantly curtail our operations, file for bankruptcy or cease operations. The consolidated financial statements do not include any adjustments relating to the recoverability and classification of recorded asset amounts or amounts and classification of liabilities that might be necessary should we be forced to take any such actions. Based upon the foregoing, our independent registered public accounting firm has included an explanatory paragraph in their report on our 2007 financial statements related to the uncertainty in our ability to continue as a going concern.

Table of Contents

The litigation with CryoCath is very complex and is being pursued in several actions. It will be very expensive to prosecute and will take years to resolve. If we are not successful in our actions, it may prevent us from being able to continue our operations.

The legal actions with CryoCath include our defense of claims by CryoCath that we infringe patents held by them. Although we do not believe we infringe any valid and enforceable claim of the CryoCath patents, we will have to spend significant time and financial resources in our defense of this lawsuit. This lawsuit will be tried before a jury in the district courts of Delaware and there can be no assurance that we will be able to obtain the financial resources necessary to defend our position, or that we will be able to convince a jury that we do not infringe the CryoCath patents. If we are not successful, it would materially harm our business and may require that we cease our operations.

Our legal actions against CryoCath also include four actions that we have initiated against CryoCath, each of which will be expensive to prosecute and that will require that we demonstrate that CryoCath infringes one or more of our valid and enforceable claims, and to establish ownership of certain claims. We will need to obtain additional financial resources to be able to prosecute these legal actions, and the financial resources that we require will be significant relative to our existing cash. If we are not able to obtain the additional financial resources needed, then we will be required to discontinue our legal actions, which may weaken the perceived or real value of our patent portfolio. Additionally, if we are not successful in any of our legal actions against CryoCath, we believe it will hinder our ability to compete with CryoCath in the commercial marketplace. Our legal actions against CryoCath have also caused, and we expect will continue to cause, a significant diversion of our management's time and attention away from our business and operations.

We have a limited operating history, have a history of operating losses, expect to continue to incur losses and may never become profitable.

We have a limited operating history and have only recently received approval from the FDA to commercialize our product in the United States for the treatment of AFL. Even though we have received approval to commercialize our product for the treatment of AFL, we have only hired a limited number of sales and marketing personnel, and do not intend to make the capital expenditures necessary to broadly commercialize our cryoablation system unless we are able to raise additional financing on satisfactory terms. We do not anticipate generating significant product revenues until we obtain FDA marketing approval of our cryoablation system for the treatment of AF and our product candidates may require additional development, clinical trials, regulatory clearances or approvals by the FDA if they are to be commercially accepted. There can be no assurance that we will be able to raise the additional capital needed to broadly commercialize our system for the treatment of AFL, and we may never broadly commercialize our system for the treatment of AFL.

As of December 31, 2007, we had an accumulated deficit of \$100.8 million. We have incurred net losses in each year since our inception in August 2000, including net losses of \$15.8 million, \$15.1 million and \$17.1 million for the years ended December 31, 2007, 2006, and 2005, respectively. We expect to continue to incur significant and increasing operating losses, in the aggregate and on a per share basis, for the next several years. These losses, among other things, have had and will continue to have an adverse effect on our stockholders' equity, net current assets and working capital. Because of the risks and uncertainties associated with developing medical devices, we are unable to predict the extent of any future losses or when we will become profitable, if at all.

We expect that our primary expenses for the next 24 months will be costs for pursuing our legal actions against CryoCath, completing our clinical trial for AF, costs associated with preparing our PMA for AF, other costs associated with new product development, costs associated with our intellectual property strategy, and costs associated with our post-market registry studies for AFL. If we are able to secure additional financing, we expect that we would also incur increased costs for commercializing our product in the United States for the treatment of AFL. We expect that our general and administrative and legal costs will continue to increase due to the additional

Table of Contents

operational and regulatory burdens applicable to public companies. If we receive FDA marketing approval of our cryoablation system for AF and we are able to secure additional financing, we expect to incur significantly increased sales, marketing, manufacturing, and compliance expenses. We do not currently have the required approval to market our cryoablation system in the United States for the treatment of AF and we may not receive this approval. We may not become profitable even if we obtain FDA approval for AF and succeed in commercializing our cryoablation system in the United States. As a result, we cannot be sure when we will become profitable, if at all.

We may need to engage in costly patent litigation against our competitors, which may harm our business, financial condition, results of operations and cash flow.

The medical device industry is characterized by a large number of patents, patent filings and frequent litigation based on allegations of patent infringement. For example, on October 18, 2007, CryoCath initiated legal proceedings against us in the United States District Court in Delaware, seeking a declaration that our cryoablation system infringes a number of CryoCath's United States issued patents. Additionally, competitors may have filed applications for or have been issued patents and may obtain additional patents and proprietary rights related to products or processes that we compete with or are similar to ours. We may not be aware of all of the patents potentially adverse to our interests that may have been issued to others. Based on the litigious nature of the medical device industry and the fact that we may pose a competitive threat to some companies who own or control various patents, we believe that as we begin to engage in and continue on with commercialization activities in the United States, there is a significant risk that one or more third parties, in addition to CryoCath, will assert a patent infringement claim, as CryoCath already has, against the manufacture, use or sale of our cryoablation system. The CryoCath lawsuit seeks damages from CryoCor and an injunction that would prevent us from selling our cryoablation system; this will be expensive to defend. Any other similar lawsuit could also seek to prevent us from commercializing our cryoablation system or enjoin us from selling it, may seek damages from us, and would likely be expensive for us to defend against. We cannot predict if or when any third party patent holder, in addition to CryoCath, will file suit for patent infringement. We can provide no assurance as to the outcome of the CryoCath litigation.

The outcome of patent litigation is subject to substantial uncertainties, especially in medical device-related patent cases that may, for example, turn on the interpretation of claim language by the court which may not be to our advantage and also the testimony of experts as to technical facts upon which experts may reasonably disagree. Our involvement in the CryoCath patent litigation will, and our involvement in other patent litigation could, result in significant expense. Some of our competitors have considerable resources available to them and a strong economic incentive to undertake substantial efforts to stop or delay us from bringing our cryoablation system to market and achieving market acceptance. We, on the other hand, are an early stage company with comparatively few resources available to us to engage in costly and protracted litigation. Moreover, regardless of the outcome, patent litigation against or by us, including the CryoCath litigation, could significantly disrupt our development and commercialization efforts, divert our management's attention and quickly consume our financial resources.

In addition, if third parties file patent applications or are issued patents claiming technology also claimed by us in pending applications, we may be required to participate in interference proceedings with the USPTO or in other proceedings outside the United States, including oppositions, to determine priority of invention or patentability. For example, we have filed requests with the USPTO seeking to invoke an interference proceeding involving certain patents owned by CryoCath. In January 2008, the USPTO determined that one of our applications claimed rights to the same technology claimed by CryoCath, and declared an interference in which we were named the senior party. If we are not successful in this proceeding, this proceeding could result in us failing to gain rights to certain patent claims. Even if we are successful, we may incur substantial costs and the time and attention of our management and scientific personnel will be diverted in pursuit of these proceedings.

Table of Contents

In the event that we are found to infringe any valid claim in a patent held by a third party, including in connection with the CryoCath litigation, we may, among other things, be required to:

pay actual damages, plus increased damages up to triple the actual damages and the other party's attorneys' fees, which may be substantial;

obtain licenses to the infringed intellectual property, which may not be available to us on acceptable terms, or at all;

cease the development, manufacture, use and/or sale of products that infringe the patent rights of others through a court-imposed sanction called an injunction;

expend significant resources to redesign our technology so that it does not infringe others' patent rights, or to develop or acquire non-infringing technology, which may not be possible; and/or

discontinue manufacturing or other processes incorporating infringing technology.

If we need to redesign our products to avoid third party patents, we may suffer significant regulatory delays associated with conducting additional studies or submitting technical, manufacturing or other information related to any redesigned product and, ultimately, in obtaining approval. Further, any such redesigns may result in less effective and/or less commercially desirable products.

Additionally, any involvement of us in litigation in which we are accused of infringement, including the CryoCath litigation, may result in negative publicity about us or our cryoablation system, injure our relations with any then-current or prospective customers and cause delays in the commercialization of our cryoablation system.

We may never receive additional milestone payments or equity investments from BSC or BSS.

Under our development and license agreement with BSC, we are responsible for modifying our existing cryoablation console to meet certain technical specifications of BSC. Even if we are able to make the requested modifications which meet the required technical specifications, it is possible that BSC may determine, in its sole judgment, that it does not wish to continue under the development and license agreement, which would mean that we would not receive any additional milestone payments or equity investments. A decision by BSC to discontinue the development and license agreement would harm our business. Additionally, even if we are successful in modifying our cryoablation console to meet BSC's technical specifications, and we receive all payments as required under the development and license agreement and common stock purchase agreement, there can be no assurance that our decision to collaborate with BSC will result in any future royalty payments, and there can be no assurance that we will receive any other benefits, commercial or financial, under our development and license agreement with BSC.

We are dependent on the success of our cryoablation system, which to date has only been approved by the FDA for the treatment of AFL in the United States. If we are unable to achieve our product development goals, gain FDA approval to commercialize our cryoablation system in the United States for the treatment of AF, or experience significant delays in doing so, our stock price may decline and we may be forced to cease operations.

We have expended significant time, money and effort in the development of our cryoablation system, which to date has only received FDA approval for the treatment of AFL. Our cryoablation system is still in clinical evaluation for the treatment of AF, has not yet received FDA approval for the treatment of AF and may never be commercialized in the United States for the treatment of AF. We do not anticipate engaging in significant commercialization activities, or generating significant product revenues, until we obtain FDA marketing approval of our cryoablation system for the treatment of AF. In our public announcements, we have provided estimates for the timing of the accomplishment of various clinical, regulatory and other product development goals relating to our cryoablation system, which we sometimes refer to as milestones. These milestones include the submission of data from our clinical trials to the FDA, the timing of FDA approval for our cryoablation system and other

Table of Contents

clinical and regulatory events. These estimates are based on a variety of assumptions. The actual timing of these milestones can vary dramatically compared to our estimates, in some cases for reasons beyond our control, and we may never achieve some or all of these milestones. For example, in January 2006, the FDA informed us that our PMA for the treatment of AFL was not approvable based on the data we had submitted. In response, we amended our PMA based upon a different analysis of chronic effectiveness, and the FDA has recently decided to approve our PMA for the treatment of AFL. If we do not meet our estimated milestones as publicly disclosed for AF, our business may be harmed and our stock price may decline. Additionally, our CMO, is currently on a leave of absence for personal reasons, and under her amended employment agreement, she can elect to terminate her employment with us for any reason between April 30, 2008 and May 31, 2008. Although we are making arrangements to be able to complete our regulatory and clinical initiatives, if she decides to terminate her employment with us, it may impact the timing of our PMA for the treatment of AF. If our cryoablation system is not approved by the FDA for the treatment of AF, or if our cryoablation system is not commercially accepted for the treatment of AFL or AF, we may be forced to cease operations.

We will need separate FDA approval supported by a separate clinical trial for each proposed indication for our cryoablation system. We intend to seek FDA approval of our cryoablation system to treat AF, and currently can only market our cryoablation system for AFL, which is the indication for which we have received FDA approval. If the FDA does not approve our cryoablation system for treating AF, we will continue to market our cryoablation system only for AFL. For each indication, the FDA's marketing approval process is expensive and the outcome is uncertain. To obtain FDA marketing approval, we are required to submit detailed and comprehensive scientific data demonstrating safety and effectiveness of our cryoablation system to the FDA's satisfaction. The marketing approval process also requires passing FDA inspection of our manufacturing facilities and of the clinical trial records for data integrity and compliance with regulatory requirements. The FDA's PMA approval review process generally takes one to three years after filing, but may take longer. The FDA has not approved any medical device for treating AF.

We cannot assure you that we will obtain FDA approval to market our cryoablation system in the United States for AF in a timely manner or at all. In addition, even though we have received FDA approval for the treatment of AFL, we may never obtain approval for AF. If we fail to obtain FDA approval for AF or if our cryoablation system is not commercially adopted for the treatment of AFL, we may be forced to cease our operations. In addition, if we do not receive FDA approval for the AF indication, we may never become profitable.

As a condition to the approval of our PMA for the treatment of AFL, the FDA is requiring us to conduct a registry study of patients treated for AFL with our cryoablation system, and of patients treated with radiofrequency catheters that are approved for the treatment of AFL. If we have difficulty completing the registry study, or if the FDA believes that the safety and effectiveness results for patients treated with our cryoablation system are not good, then the FDA could rescind the approval of our device for the treatment of AFL.

As a condition of FDA approval for marketing of our cryoablation system for the treatment of AFL, we agreed to conduct a registry study of patients treated for AFL with our cryoablation system, and to include as part of the registry study patients treated for AFL with competing radiofrequency devices approved for the treatment of AFL. The FDA could determine that the results we obtain of patients treated with cryoablation do not justify continuing to make our product available for commercialization in the United States, and they could rescind our approval for the treatment of AFL. Additionally, although we intend to begin the registry study in the second half of 2008 and will seek to complete the enrollment as soon as possible, we may not be able to find patients who agree to join our registry study and it is possible that the FDA could believe that we are not actively working to complete the registry study and rescind our approval for the treatment of AFL on that basis until additional data is collected. If the FDA chooses to rescind the approval of our product for the treatment of AFL, our business would be materially harmed and our stock price would likely decline substantially, and we may not be able to reinstate our ability to commercialize our product in the United States for the treatment of AFL.

Table of Contents

If the data from our AF clinical trial does not demonstrate the safety and effectiveness of our cryoablation system to the FDA's satisfaction, we will not receive FDA approval to market our cryoablation system in the United States for the treatment of AF.

To obtain FDA approval for marketing of our cryoablation system for the treatment of AF, our pivotal trial for AF must generate data demonstrating that our cryoablation system is safe and effective. The FDA's grant of permission to proceed with the AF pivotal trials does not constitute a binding commitment that the FDA will consider either trial design adequate to support approval for our cryoablation system. In addition, there can be no assurance that the data generated during the pivotal trial will meet our chosen safety and effectiveness endpoints or otherwise produce results that will lead the FDA to grant marketing approval. We may never receive PMA approval from the FDA for the treatment of AF.

We may not complete our pivotal trial for AF on schedule, or at all, or it may be conducted improperly, which may delay or preclude FDA approval for marketing our cryoablation system for this indication.

The completion of our pivotal trial for AF may be delayed or terminated for many reasons, including, but not limited to:

the departure of our Chief Medical Officer, if she elects to terminate her employment with us before we file our PMA;

the FDA places our pivotal trial on hold;

insufficient capital to fund the pivotal trial;

lack of availability of the catheters used in the pivotal trial;

recalls of the catheters used in the pivotal trial;

subjects are not followed-up at the rate we currently expect;

subjects experience an unacceptable rate or severity of adverse side effects;

third party clinical investigators do not perform our pivotal trial on our anticipated schedule or consistent with the clinical trial protocol, Good Clinical Practice and regulatory requirements, or other third party organizations do not perform data collection and analysis in a timely or accurate manner;

inspections of our clinical trial sites by the FDA or Institutional Review Boards, or IRBs, find regulatory violations that require us to undertake corrective action, suspend or terminate one or more sites, or prohibit us from using some or all of the data in support of our PMA application;

the reimbursement by governmental and other third party payers changes;

one or more of the IRBs for our clinical trial sites suspends or terminates our trial at an investigational site, precludes enrollment of additional subjects, or withdraws its approval of our trial;

one or more of our clinical investigators withdraws from our trial or deviates from our approved protocol; or

third parties, investigators and contract laboratories conducting our pivotal trial do not perform as contractually required or expected. Subject enrollment in clinical trials and successful completion of subject follow-up in clinical trials depend on many factors, including the size of the subject population, the nature of the trial protocol, the proximity of subjects to clinical sites, the eligibility criteria for the trial, and subject compliance. Subjects may be discouraged from continuing to participate in our clinical trial if the trial protocol requires them to undergo extensive pre- and post-treatment procedures to assess the safety and effectiveness of our cryoablation system. We have seen a higher withdrawal rate of patients than we originally anticipated in our AF clinical trial. Withdrawal rates may continue to increase as we conduct our AF clinical trial because the follow up period for the AF trial is 12 months

Table of Contents

as opposed to six months for the AFL trial. In addition, subjects participating in our clinical trial may die before completion of their follow-up. Moreover, it may be difficult to successfully follow our subjects for the required 12-month period. Although to date we have successfully followed all our subjects from our AF feasibility study for the required 12-month period, historical results may not be indicative of our future performance. Additionally, we have seen a higher withdrawal rate of patients than we originally anticipated which required us to request from the FDA that we be able to enroll more than the 160 patients originally planned. In January 2007, the FDA approved our request to increase the size of our pivotal trial. The FDA may require that we enroll additional patients in order to complete our dataset.

Failure of subjects to continue to participate in a trial may cause an increase in costs and delays in our clinical trial or result in the failure of the trial, which could cause us to fail to secure FDA marketing approval of our cryoablation system in a timely manner, if at all.

Our development costs will increase if we have material delays in our clinical trial or if we need to perform additional or larger clinical trials than planned. Serious or unexpected adverse events during a clinical trial could cause us to modify, suspend, repeat, or terminate a trial, or to cancel the entire program.

We may need to enroll additional patients to be able to demonstrate safety and effectiveness of our device, if our dataset of evaluable patients for our AF pivotal trial is not deemed large enough.

When we designed the size of our AF pivotal trial, we made certain assumptions about the number of patients to be enrolled to permit us to evaluate the results of each arm of our clinical trial. During the conduct of our pivotal trial, patients have withdrawn from our clinical study for reasons not in our control, such as, they were randomized to medical management, or drug therapy, or were not covered by insurance, and withdrew from the trial. If we do not have a sufficiently large evaluable patient population for our analysis when we have completed enrollment and patient follow-up, we may need to increase enrollment until we can generate a sufficiently large evaluable patient population. For example, the FDA has approved our request to enroll an additional 20 patients, up to 180 patients in total.

In order to receive and maintain FDA approval of our product candidates, our manufacturing facilities and the manufacturing facilities of our suppliers must comply with applicable regulatory requirements. If we fail to achieve or maintain regulatory approval of these manufacturing facilities, we may be forced to cease operations.

Commercialization of our products and product candidates require access to, or the development of, manufacturing facilities that meet applicable regulatory and quality standards to manufacture a sufficient supply of our products. We believe we will need eventually to obtain additional commercial-scale manufacturing facilities. These facilities must be evaluated and qualified under our quality system to ensure that they meet our production and quality standards. The FDA also must inspect and approve facilities that manufacture our products for United States commercial purposes, as well as the manufacturing processes and specifications for our products prior to granting marketing approval of our cryoablation system. Suppliers of certain components of, and products used to manufacture, our products also must comply with FDA and foreign regulatory requirements, which often require significant resources and subject us and our suppliers to potential regulatory inspections and stoppages. We or our suppliers may not satisfy these requirements. If we or our suppliers do not achieve and maintain required regulatory approval for our manufacturing operations, including for any additional commercial-scale manufacturing facilities that we may obtain in the future, our commercialization efforts in the United States, if any, could be delayed, which could impair our business and financial condition and could require us to cease operations.

Table of Contents

If the integrity of a catheter used as part of our cryoablation system is compromised, serious injury or death may occur, which could lead the FDA to delay or deny or withdraw marketing approval.

Our cryoablation system works by utilizing a pressurized system that delivers nitrous oxide to chill the tip of a catheter to freeze heart tissue in contact with the catheter tip while the catheter is in contact with the patient's heart. Although our cryoablation system is designed to prevent leaks in the catheter and to prevent the flow of nitrous oxide into the catheter if the catheter has been ruptured, nitrous oxide could enter the blood stream if the catheter developed a leak, which could result in serious injury to a patient, or even death. In April 2005, during routine quality control testing of a lot of Model 1200 catheters, we identified several instances of inadequate seals in the joint where the articulation section is welded to the catheter shaft, which could have allowed a leak of nitrous oxide into a patient. We initiated an investigation which covered several weeks to identify the source of the catheter integrity breaches, but were unable to find a specific root cause. In May 2005, we initiated a voluntary recall in Europe of all eight of the outstanding lots of our Model 1200 catheter and removed the Model 1200 from clinical trial use.

If a future leak were to occur, the FDA could deny or delay or withdraw marketing approval until we modified our device and provided proof that a similar failure could not recur. Any future leak could lead to additional recalls, cause us to incur financial liability and prevent our system from gaining market acceptance among physicians, healthcare payers, patients and the medical community, any of which could harm our business, financial condition, results of operations and growth prospects.

If the pulmonary vein isolation, or PVI, or any other ablation procedure performed in our AF pivotal trial fails to provide a significant benefit to patients, or has serious adverse effects, we may not be able to obtain FDA approval for marketing our cryoablation system.

AF is a complex disease and its origin and progression are not well understood in the medical community. The effectiveness of ablation in moderating AF has not been demonstrated in a controlled clinical trial. The FDA could deny approval of our cryoablation system if our pivotal AF trial does not show that AF ablation performed with our cryoablation system provides a greater benefit to patients than medical management with anti-arrhythmic medications alone.

The PVI procedure when performed with radiofrequency ablation has been associated with stroke and pulmonary vein stenosis, a narrowing of the pulmonary vein that can have serious adverse health implications. Radiofrequency ablation and other heat based ablation technologies used for AF ablation have been associated with risks such as the formation of atrial esophageal fistulas, or channels, between the heart and the esophagus. Although we believe that cryoablation reduces this risk as compared to heat-based ablation, we and the medical community do not have a complete understanding of the presentation and progression of these complications. If patients have strokes, develop significant pulmonary vein stenosis, atrio-esophageal fistulas, or other unanticipated adverse effects in our pivotal AF trial, the FDA could deny approval to market our cryoablation system, which could harm our business, financial condition, results of operations and growth prospects.

If approved by the FDA for AF, our cryoablation system will likely be limited to use as a second line therapy for patients with AF who have failed drug treatment, which could limit our sales.

Our pivotal AF trial will study our cryoablation system only in patients who have failed drug therapy. For this reason, if the FDA approves our cryoablation system for the treatment of AF, it is likely that the FDA will require us to label and advertise our cryoablation system only for the treatment of patients who have failed drug therapy. This restriction could limit our sales. Additional clinical trials will be required to obtain approval for use in a broader population of patients.

Table of Contents

Our future growth depends on physician adoption and market acceptance of our cryoablation system, which may not occur.

Our cryoablation system may not gain market acceptance among physicians, patients, healthcare payers or the medical community. The degree of market acceptance of any product that we may develop will depend on a number of factors, including:

the perceived safety and effectiveness of the product;

the prevalence and severity of any side effects;

the procedure time associated with the use of the product;

potential advantages over alternative treatments;

our ability to adequately fund the commercialization of the product;

the strength of marketing and distribution support; and

sufficient third party coverage or reimbursement.

If our cryoablation system, or any other product that we may develop, does not achieve an adequate level of acceptance by physicians, patients or healthcare payers, we may not generate significant product revenue, if any, and we may not become profitable.

We believe that another factor that will impact the degree of market acceptance of any of our products is our ability to educate physicians to change their screening and referral practices in order to ensure physician acceptance of our system. For example, despite the lack of effectiveness of treating AF and AFL with drugs, many physicians routinely prescribe drugs to patients suffering from AF and AFL without offering any treatment alternatives even when drug therapy is failing. We intend to target our sales efforts to electrophysiologists because they are often the physicians treating both AF and AFL. However, the initial point of contact of patients experiencing AF and AFL may be general practitioners. If referring physicians are not properly educated about AF and AFL and the potential benefits of using our cryoablation system over drug therapy in particular in circumstances where drug therapy fails, they may not refer AF and AFL patients who have been unsuccessfully treated with drug therapy to electrophysiologists for our cryoablation system procedure, which may impair our business, financial condition and results of operations.

Our product candidates could be recalled and any failure to comply with FDA regulations could subject us to enforcement action.

The FDA and similar foreign governmental authorities have the authority to require the recall of commercialized products in the event of material regulatory deficiencies or defects in design or manufacture. A government mandated or voluntary recall by us could occur as a result of component failures, device malfunctions, adverse events, such as serious injuries or deaths, or quality-related issues such as manufacturing errors or design or labeling defects. Recalls of our cryoablation system would divert managerial and financial resources, harm our reputation with customers and have an adverse effect on our financial condition and results of operations. A recall announcement could also negatively affect our stock price.

After the FDA permits a device to enter commercial distribution, numerous additional regulatory requirements apply. We may incur significant costs to comply with such requirements. These requirements include, among others:

Edgar Filing: CRYOCOR INC - Form 10-K

compliance with the Quality System Regulations, which require manufacturers to follow elaborate design, testing, control, documentation and other quality assurance procedures during the manufacturing process;

the FDA's general prohibition against promoting products for unapproved or off-label uses;

Table of Contents

the Medical Device Reporting regulation, which requires that manufacturers report to the FDA if their device may have caused or contributed to a death or serious injury or malfunctioned in a way that would likely cause or contribute to a death or serious injury if it were to recur; and

the Reports of Corrections and Removals regulation, which requires manufacturers to report recalls and field actions to the FDA if initiated to reduce the risk to health posed by the device or to remedy a violation of the Federal Food, Drug, and Cosmetic Act, or FDCA.

Even if our products are approved, stringent FDA conditions of approval may significantly impact our sales and earnings depending on the scope and complexity of such conditions. The FDA enforces these requirements with inspections and market surveillance. If the FDA finds that we have failed to comply with one of these requirements, it could institute a wide variety of enforcement actions, ranging from a Warning Letter to more severe sanctions, including the following:

finances, injunctions and civil penalties;

recall or seizure of our products;

operating restrictions, partial suspension or total shutdown of production;

refusing requests for 510(k) clearance or PMA approval of new products;

withdrawing 510(k) clearance or PMA approvals already granted; and

criminal prosecution.

Any of these enforcement actions could be costly and significantly harm our business, financial condition and results of operations.

If we are unable to obtain and maintain protection for our intellectual property, the value of our technology and products may be adversely affected.

Our business and competitive positions are dependent upon our ability to protect our proprietary technology. Because of the substantial length of time and expense associated with development of new products, we, along with the rest of the medical device industry, place considerable importance on obtaining and maintaining patent protection for new technologies, products and processes. The patent positions of medical device companies, including ours, are generally uncertain and involve complex legal and factual questions. Our owned and licensed patent applications may not protect our technologies and products because, among other things:

any patents issued to us, our collaborators or our licensors, may not provide a basis for a commercially viable product or provide us with any competitive advantage;

any patents issued to us, our collaborators or our licensors may be challenged, as is currently ongoing in the CryoCath litigation, circumvented or invalidated by third parties;

all pending patent applications may not result in issued patents; and

any additional proprietary technologies that we develop may not be patentable.

We attempt to protect our intellectual property position by filing United States patent applications related to our proprietary technology, inventions and improvements that are important to the development of our business. We also protect our intellectual property position by pursuing infringement actions against other companies that we believe infringe our valid and enforceable IP. For example, we have initiated several actions against CryoCath that we believe are necessary for us to protect our intellectual property position. These actions include a pending interference declared by the United States Patent and Trade Office, an investigation of CryoCath by the United States International Trade Commission, and litigation that we have initiated in the district courts of Delaware and in Canada. Currently, we own or license 39 issued United States patents and a number of pending United States patent applications covering various aspects of our products and technology.

Table of Contents

We also own or license 24 patents issued outside of the United States and have a number of pending patent applications outside the United States. Limitations on patent protection in some countries outside the United States, and the differences in what constitutes patentable subject matter in these countries, may limit the protection we have under patents issued to us outside of the United States. In addition, laws of foreign countries may not protect our intellectual property to the same extent as would laws of the United States. In determining whether or not to seek a patent or to license any patent in a particular foreign country, we weigh the relevant costs and benefits, and consider, among other things, the market potential of our product candidates in the jurisdiction, and the scope and enforceability of patent protection afforded by the law of the jurisdiction. Failure to obtain adequate patent protection for our proprietary product candidates and technology would impair our ability to be commercially competitive in these markets.

Our ability to market our products may be impaired by the intellectual property rights of third parties.

We are aware of numerous United States patents owned or licensed by third parties in areas potentially related to the technology used in our cryoablation system. These third parties include CryoCath, Johnson & Johnson, the Regents of the University of California and Spemby Medical Ltd. These third parties or our other competitors may have issued patents that cover technologies that we use in producing our product candidates, or that we use in treating patients with our product candidates. CryoCath initiated legal proceedings against us in the United States District Court in Delaware, seeking a declaration that our cryoablation system infringes a number of CryoCath's United States issued patents. Other owners of patents or their licensees may also assert that the manufacture, use or sale of our cryoablation system infringes one or more claims of their patents.

The possibility of litigation, in addition to the CryoCath litigation, being filed against us based on one or more of these or other patents or other intellectual property is a significant risk. Because of the uncertainty inherent in any intellectual property litigation, a court may determine that current or future third party patents, including CryoCath patents, contain one or more claims that are valid, enforceable and infringed upon by our cryoablation system.

There is also a risk that other third party patents or intellectual property rights in areas of technology related to our products of which we are not aware may materially and adversely affect our business. Moreover, because patent applications can take many years to issue, there may be currently pending patent applications of which we are not yet aware that may result in issued patents that if successfully asserted against us, would materially and adversely affect our business, financial condition and results of operations.

We depend on single source suppliers for our cryoablation system components and the loss of these suppliers could prevent or delay our clinical trials, commercialization of our cryoablation system in the United States and additional sales of our cryoablation system in Europe.

We do not have long-term contracts with our third party suppliers for any of the equipment and components that are used in our manufacturing process. Our suppliers may have difficulty supplying components that meet our required specifications or needs. None of our suppliers has agreed to maintain a guaranteed level of production capacity. Establishing additional or replacement suppliers for these components may cause us to incur substantial costs and take a considerable amount of time, may require product redesign and could result in the need for submission to the FDA of a PMA supplement or possibly a separate PMA, which would cause us to incur considerable expense. We also may have difficulty obtaining similar components from other suppliers that are acceptable to our quality requirements and specifications, the FDA or foreign regulatory authorities. Even if available, similar components from other suppliers could be significantly more expensive. Any delays, regulatory or otherwise, could delay the manufacture and delivery of our cryoablation system and impact the commercialization of our cryoablation system in the United States and sales of our cryoablation system in Europe and adversely impact our business.

Table of Contents

If we are unable to manage our growth, our future revenue and operating results may be adversely affected.

We will need to expand our sales and marketing operations and grow our research and development, product development and administrative operations. This expansion would place a significant strain on our management and operational and financial resources. Our current and planned personnel, systems, procedures and controls may not be adequate to support our growth. To manage our growth and in connection with commercializing our cryoablation system in the United States, we will be required to improve existing, and implement new, operational and financial systems, procedures and controls and expand, train and manage our growing employee base. If we were unable to manage our growth effectively, our business and operating results could be harmed.

We have limited manufacturing capabilities and manufacturing personnel, and if our manufacturing facilities are unable to provide an adequate supply of products, our growth could be limited and our business could be harmed.

We currently manufacture our cryoablation system at our facilities in San Diego, California. If there was a disruption to our manufacturing operations, we would have no other means of manufacturing our cryoablation system until we have restored and re-qualified our manufacturing capability at our facilities or developed alternative manufacturing facilities. Additionally, any damage to or destruction of our San Diego facilities or our equipment, prolonged power outage or contamination at our facility would significantly impair our ability to produce our cryoablation system. If we were unable to produce sufficient quantities of our cryoablation system for use in our planned clinical trials, commercialization activities for AFL and AF in the United States, as well as sales of our cryoablation systems in Europe, would be delayed.

We currently have limited resources, facilities and experience to commercially manufacture our products and product candidates. In the first half of 2006, we restructured our workforce, including reductions in our manufacturing staffing that has reduced our capacity to manufacture catheters and consoles. Currently, we can only produce sufficient quantities of catheters to support our expected commercial sales for 2008. To produce our cryoablation system in the quantities that we believe will be required to meet anticipated market demand in the United States in the event that we receive regulatory approval for AF, we will need to increase, or scale up, the production process by a significant factor over the current level of production. There are technical challenges to scaling up manufacturing capacity, and developing commercial-scale manufacturing facilities would require the investment of substantial additional funds and hiring and retaining additional management and technical personnel who have the necessary manufacturing experience. We may not successfully complete any required scale up in a timely manner, or at all due to such technical difficulties and/or insufficient funds. If we are unable to do so, we may not be able to produce our cryoablation system in sufficient quantities to meet the requirements for the launch of the product in the United States if we receive the required regulatory approval from the FDA for AF, or to meet demand for our cryoablation system in the United States for AFL or in Europe. If we obtain regulatory approval from the FDA for our cryoablation system for AF but are unable to manufacture a sufficient supply of our cryoablation systems, our revenues, business and financial prospects would be materially adversely affected. In addition, if we obtain regulatory approval for our cryoablation system for AF, but the scaled up production process is not efficient or produces cryoablation systems that do not meet quality and other standards, our future gross margins, if any, will be adversely affected.

We have never manufactured our Quantum catheter in large quantities, and we may experience delays and difficulties in our manufacturing of this catheter.

Our Quantum catheter is more complicated to manufacture than our CryoBlator catheter, and our experience in manufacturing the initial prototypes indicate that it will take longer to manufacture a single Quantum catheter than as required to manufacture a single CryoBlator catheter. This complexity may delay our ability to advance the Quantum catheter into human clinical trials. However, we believe we will develop efficiencies in manufacturing our Quantum catheter to permit us to manufacture it in a commercially viable amount of time. For example, the time required to initially manufacture the Model 1100 catheter, and time required to initially

Table of Contents

manufacture the Model 1200 catheter, were substantially longer than the time currently required to manufacture our CryoBlator catheter. In addition, after we have conducted further animal studies, we may determine that Quantum is not suitable for human use, and we may discontinue the development of the catheter.

We must be licensed to handle and use hazardous materials and may be liable for contamination or other harm caused by hazardous materials that we use.

We use hazardous materials in our research and development and manufacturing processes. We are subject to federal, state and local regulations governing use, storage, handling and disposal of these materials and waste products. We are currently licensed to handle such materials in all states in which we operate, but there can be no assurances that we will be able to retain those licenses in the future. In addition, we must become licensed in all states in which we plan to expand. Obtaining those additional licenses is an expensive and time consuming process, and in some cases we may not be able to obtain those licenses at all.

Although we believe that our procedures for the use, handling, storing and disposing of these materials comply with legally prescribed standards, we cannot completely eliminate the risk of contamination or injury resulting from hazardous materials and we may incur liability as a result of any such contamination or injury. In the event of an accident, we could be held liable for damages or penalized with fines, and the liability could exceed our resources. We have also incurred and may continue to incur expenses related to compliance with environmental laws. Such future expenses or liability could have a significant negative impact on our business, financial condition and results of operations. Further, we cannot assure you that the cost of complying with these laws and regulations will not materially increase in the future.

Quality-control difficulties in our manufacturing processes could delay our clinical development programs and commercialization activities or prevent us from continuing the development of our product candidates.

Our sterile products, including our catheters and our sheaths, must be produced in a highly controlled, clean environment to minimize foreign particles and other contaminants. Despite stringent quality controls, weaknesses in process control or minute impurities in materials may cause a substantial percentage of defective products in a lot. If we are unable to maintain stringent quality controls, or if contamination problems arise, our clinical development and commercialization activities in the United States and our sales efforts in Europe could be delayed or terminated, which would harm our business, financial condition and results of operations.

If we fail to obtain an adequate level of reimbursement for our products by third party payers, there may be no commercially viable markets for our product candidates or the markets may be much smaller than expected.

The availability and amount of reimbursement by governmental and other third party payers affect the market for our products and product candidates. The effectiveness, safety, performance and cost-effectiveness of our products and product candidates and of any competing products will determine the availability and level of reimbursement. We believe that reimbursement may be subject to increased restrictions both in the United States and in international markets in the future. New legislation, regulation or reimbursement policies of third party payers may adversely affect the demand for our products and product candidates and limit our ability to sell our products and product candidates on a profitable basis. In addition, third party payers continually attempt to minimize or reduce the costs of healthcare by challenging the prices charged for healthcare products and services.

Reimbursement and healthcare payment systems in international markets vary significantly by country, and include both government sponsored healthcare and private insurance. To obtain reimbursement or pricing approval in some countries, we may be required to produce clinical data, which may involve one or more clinical trials, that compares the cost-effectiveness of our products to other available therapies. We may not obtain international reimbursement or pricing approvals in a timely manner, or at all. Our failure to receive international reimbursement or pricing approvals would negatively impact market acceptance of our products in the international markets in which those approvals are sought.

Table of Contents

If reimbursement for our products is unavailable or limited in scope or amount, or if pricing is set at unsatisfactory levels, market acceptance of our products would be impaired and our business, financial condition, results of operations and future revenues, if any, would be adversely affected.

We may be subject, directly or indirectly, to federal and state healthcare fraud and abuse laws and regulations and, if we are unable to fully comply with such laws, could face substantial penalties.

Our operations may be directly or indirectly affected by various broad state and federal healthcare fraud and abuse laws, including the Federal Healthcare Programs Anti-Kickback Statute, which prohibits any person from knowingly and willfully offering, paying, soliciting or receiving remuneration, directly or indirectly, to induce or reward either the referral of an individual for an item or service, or the ordering, furnishing or arranging for an item or service, for which payment may be made under federal healthcare programs, such as the Medicare and Medicaid programs. If our past or present operations, including our consulting arrangements with physicians who use our product, are found to be in violation of these laws, we or our officers may be subject to civil or criminal penalties, including large monetary penalties, damages, fines, imprisonment and exclusion from Medicare and Medicaid program participation. If enforcement action were to occur, our business and financial condition would be harmed.

We may be subject to federal and state false claims laws which impose substantial penalties.

Now that we are selling our product in the United States, it is possible that some of our customers may file claims for reimbursement with government programs such as Medicare and Medicaid. As a result, we may be subject to the federal False Claims Act if we knowingly cause the filing of false claims. Violations may result in substantial civil penalties, including treble damages. The federal False Claims Act also contains whistleblower or qui tam provisions that allow private individuals to bring actions on behalf of the government alleging that the defendant has defrauded the government. In recent years, the number of suits brought in the healthcare industry by private individuals has increased dramatically. Various states have enacted laws modeled after the federal False Claims Act, including qui tam provisions, and some of these laws apply to claims filed with commercial insurers.

We are unable to predict whether we could be subject to actions under the federal False Claims Act, or the impact of such actions. However, the costs of defending claims under the False Claims Act, as well as sanctions imposed under the False Claims Act, could significantly affect our financial performance.

If we are unable to establish adequate sales and marketing capabilities or enter into and maintain arrangements with third parties to sell and market our cryoablation system, our business may be harmed.

We have just begun building a sales organization in the United States and have limited experience as a company in the sales, marketing and distribution of medical devices. Now that we have received FDA approval of our PMA for AFL, we are commercializing in the United States with a direct CryoCor sales force, and may market in the United States with a marketing partner. Developing a sales force is expensive and time consuming and could delay or limit the success of our commercialization activities. We may not be able to develop this capacity on a timely basis or at all. Additionally, due to our limited cash resources, we will not hire the additional personnel or make the capital expenditures that are necessary to broadly commercialize our cryoablation system unless we are able to raise additional financing on satisfactory terms. We may choose to contract with third parties, including distributors or agents, to perform sales, marketing and distribution services in the United States. If we enter into arrangements with third parties to perform sales, marketing and distribution services in the United States, our product revenues could be lower than if we directly sold, marketed and distributed our cryoablation system, or any other product that we may develop. Furthermore, if we enter into co-promotion or other marketing and sales arrangements with third parties, any revenues received will depend in part on the skills and efforts of these third parties, and we do not know whether these efforts will be successful. Some or all of our future distributors may have products or product candidates that compete with ours, and they may have an incentive not to devote their best efforts to marketing our products.

Table of Contents

We have signed distribution agreements with third parties in Europe to market and sell our cryoablation system in the United Kingdom and Italy. In the near term, we do not intend to sign additional distribution agreements in Europe and we may never sign additional distribution agreements. If our relationships with our distributors do not progress as anticipated, if we seek to identify alternative distributors and are unable to do so, or if their sales and marketing strategies fail to generate sales of our products in the future, our business, financial condition and results of operations would be harmed. We have closed our subsidiary in Germany through which we historically distributed our product in Belgium, the Netherlands and Germany and as a result may no longer continue to sell our product in these geographic areas.

The medical device industry is highly competitive and subject to rapid technological change. If our competitors are better able to develop and market products for similar indications that are safer, more effective, or gain greater acceptance in the marketplace than any products that we may develop, our commercial opportunities will be reduced or eliminated.

The medical device industry is characterized by rapidly advancing technologies and a strong emphasis on proprietary products, designs and processes and intense competition. Our products and product candidates face and will face intense competition. Many of our competitors have significantly greater financial resources and expertise in research and development, manufacturing, preclinical testing, conducting clinical trials, obtaining regulatory approvals and marketing approved products than we do. Smaller or early stage companies may also prove to be significant competitors, particularly through collaborative arrangements with large and established companies. These third parties compete with us in recruiting and retaining qualified personnel, establishing clinical trial sites and patient registration for clinical trials, as well as acquiring technology and technology licenses complementary to our programs or advantageous to our business.

Our competitors may:

develop and patent processes or products earlier than us;

obtain regulatory approvals for competing products more rapidly than us; and

develop safer, more effective and/or less expensive products or technologies that render our technology or products or product candidates obsolete or non-competitive.

If any of the foregoing occurs, our business will be harmed and our commercial opportunities will be reduced or eliminated.

We face the risk of product liability claims and may not be able to obtain insurance on favorable terms, or at all.

Our business exposes us to the risk of product liability claims that are inherent in the testing, manufacturing and marketing of medical devices. We may be subject to product liability claims, including frivolous lawsuits, if our cryoablation system causes, or appears to have caused, an injury. Claims may be made by consumers, healthcare providers, third party strategic collaborators or others selling our products. Although we have product liability and clinical trial liability insurance that we believe is appropriate for our company, this insurance is subject to deductibles and coverage limitations. Our current product liability insurance may not continue to be available to us on acceptable terms, if at all, and, if available, the coverage may not be adequate to protect us against any future product liability claims. If we are unable to obtain insurance at acceptable cost or on acceptable terms with adequate coverage or otherwise protect against potential product liability claims, we will be exposed to significant liabilities, which may harm our business. A product liability claim, recall or other claim with respect to uninsured liabilities or for amounts in excess of insured liabilities could have a material adverse effect on our business, financial condition and results of operations.

We may be subject to claims against us even if an alleged injury is due to the actions of others. For example, we rely on the expertise of physicians, nurses and other associated medical personnel to perform the medical procedures and related processes relating to our cryoablation system. If these medical personnel are not properly

Table of Contents

trained or are negligent in using our cryoablation system, the therapeutic effect of our cryoablation system may be diminished or the patient may suffer critical injury, which may subject us to liability. In addition, an injury resulting from the activities of our suppliers may serve as a basis for a claim against us.

We do not and will not promote our cryoablation system for off-label or otherwise unapproved uses. However, we cannot prevent a physician from using our cryoablation system for any off-label applications. If injury to a patient results from such an inappropriate use, we may become involved in a product liability suit, which will likely be expensive to defend.

These liabilities could prevent or interfere with our clinical efforts, product development efforts and any subsequent product commercialization efforts. Defending a suit, regardless of merit, could be costly, could divert management attention and might result in adverse publicity, which could result in the withdrawal of, or inability to recruit, clinical trial volunteers or reduced acceptance of our products in the market.

Failure to obtain additional regulatory approval in foreign jurisdictions will prevent us from expanding the commercialization of our products abroad.

We may pursue marketing our products in a number of international markets. Although our cryoablation system has been approved for commercialization in the European Union, or EU, and for the treatment of AFL in the United States, in order to market our products in other foreign jurisdictions, we will need to obtain separate regulatory approvals. The approval procedure varies among jurisdictions and can involve substantial additional testing. Approval by the FDA does not ensure approval by regulatory authorities in other jurisdictions, and approval by one foreign regulatory authority does not ensure approval by regulatory authorities in other foreign jurisdictions or by the FDA. The foreign regulatory approval process may include all of the risks associated with obtaining FDA approval in addition to other risks. In addition, the time required to obtain foreign approval may differ from that required to obtain FDA approval and we may not obtain foreign regulatory approvals on a timely basis, if at all. We may not be able to file for regulatory approvals and may not receive necessary approvals to commercialize our products in any market other than in the EU and in the United States for the treatment of AFL.

Our efforts to discover, develop and commercialize new product candidates beyond our cryoablation system are at an early stage and are subject to a high risk of failure.

We expect that a key element of our strategy will be to discover, develop and commercialize new products for the treatment of AFL and AF as extensions of, or in addition to, our cryoablation system. For example, we are completing development of our next generation catheter, Quantum, which we expect to introduce into clinical testing in the first quarter of 2008. Research programs to identify new product candidates require substantial technical, financial and human resources, whether or not any product candidates are ultimately identified. Our research programs may initially show promise in identifying potential product candidates, yet fail to yield product candidates for clinical development for many reasons, including the following:

the research may not be successful in identifying potential product candidates;

there is a high rate of attrition for product candidates in preclinical trials;

competitors may develop alternatives that render our product candidates obsolete; and

product candidates may on further study be shown to have harmful side effects or other characteristics that indicate they are unlikely to be effective.

If we fail to develop and commercialize new product candidates, our business would be harmed.

Table of Contents

We are highly dependent on our officers and other employees, and if we are not able to retain them or to recruit and retain additional qualified personnel, our business will suffer.

We are highly dependent upon our senior management and scientific staff. The loss of services of one or more of our members of senior management could delay or prevent the successful completion of our pivotal trials or the commercialization of our cryoablation system in the United States. Although we have employment agreements with each of our executive officers, their employment with us is at will, and each executive officer can terminate his agreement with us at any time. In February 2008, we amended our employment agreement with our CMO. Our CMO is currently on a leave of absence for personal reasons, and under the amended employment agreement, she can elect to terminate her employment with us for any reason between April 30, 2008 and May 31, 2008, and will be entitled to the severance benefits provided for in her existing employment agreement. We do not carry keyman insurance on any of our current executive officers.

In the event we need to hire additional qualified scientific, commercial, operations, regulatory, quality assurance and control and administrative personnel, we may not be able to attract and retain qualified personnel on acceptable terms given the competition for such personnel among medical device companies. Our offices are located in San Diego, where competition for personnel with healthcare industry skills is intense. If we fail to identify, attract, retain and motivate these highly skilled personnel, or if we lose current employees, we may be unable to continue our development and commercialization activities.

We may incur increased costs as a result of recently enacted and proposed changes in laws and regulations.

Recently enacted and proposed changes in the laws and regulations affecting public companies, including the provisions of the Sarbanes-Oxley Act of 2002, or the Sarbanes-Oxley Act, and rules related to corporate governance and other matters subsequently adopted by the SEC and the Nasdaq Stock Market, or Nasdaq, could result in increased costs to us and may divert our management's attention from other matters that are important to our business. The new rules and any related regulations that may be proposed in the future could make it more difficult or more costly for us to obtain certain types of insurance, including directors' and officers' liability insurance, and we may be forced to accept reduced policy limits and coverage or incur substantially higher costs to obtain the same or similar coverage. The impact of these events could also make it more difficult for us to attract and retain qualified persons to serve on our board of directors, our board committees or as executive officers. We are presently evaluating and monitoring developments with respect to new and proposed rules and cannot predict or estimate the amount of the additional costs we may incur or the timing of such costs.

Legislative and regulatory proposals to amend the FDA regulatory and healthcare systems could impact our ability to sell our products profitably, if at all. In the United States in recent years, new legislation has been proposed at the federal and state levels that would effect major changes in the healthcare system. In addition, new regulations and interpretations of existing healthcare statutes and regulations are frequently adopted.

Failure to achieve and maintain effective internal controls in accordance with Section 404 of the Sarbanes-Oxley Act could have a material adverse effect on our business and stock price.

As a public company, we will be required to document and test our internal control procedures in order to satisfy the requirements of Section 404 of the Sarbanes-Oxley Act, which requires, among other things, annual management assessments of the effectiveness of our internal controls over financial reporting and, for 2008, a report by our independent registered public accounting firm on our internal controls over financial reporting. During the course of our future testing, we may identify deficiencies which we may not be able to remediate in time to meet our deadline for compliance with Section 404.

Testing and maintaining internal controls also involves significant costs and could divert our management's attention from other matters that are important to our business. We may not be able to conclude on an ongoing basis that we have effective internal controls over financial reporting in accordance with Section 404, and our independent registered public accounting firm may not be able to issue an unqualified opinion on our internal

Table of Contents

controls over financial reporting. Failure to achieve and maintain an effective internal control environment could harm our operating results and could cause us to fail to meet our reporting obligations. Inferior internal controls could also cause investors to lose confidence in our reported financial information, which could have a negative effect on the trading price of our stock.

Changes in European to United States currency exchange rates may increase our expenses or reduce our revenues.

We currently market our cryoablation system in certain foreign markets through European distributors. The related distribution agreements may provide for payments in a foreign currency. Accordingly, if the United States dollar strengthens against the euro or British pound sterling our United States dollar payments from such distributors, if any, will decrease.

We may become exposed to fluctuations in other foreign currencies in the future, and our exposure to foreign currency exchange rates may adversely affect our business, financial condition and results of operations.

Our stock price has been volatile and may continue to be volatile.

Our stock price has been and may continue to be volatile. The stock market in general and the market for small medical device companies in particular have experienced extreme volatility that has often been unrelated to the operating performance of particular companies. The price for our common stock will be determined in the marketplace and may be influenced by many factors, including:

developments, disputes or litigation concerning patents or other proprietary rights, including our current litigation with CryoCath;

failure of any of our products or product candidates to achieve commercial success;

results of our clinical trials;

failure of any of our product candidates to receive FDA or other regulatory approvals;

success or failure to raise any additional capital on a timely basis or on acceptable terms;

future sales of our common stock;

regulatory developments in the United States and foreign countries;

ability to manufacture our products to commercial standards;

public concern over our products;

the departure of key personnel;

variations in our financial results or those of companies that are perceived to be similar to us;

changes in the structure of healthcare payment systems;

changes in reimbursement;

investors' perceptions of us; and

general economic, industry and market conditions.

A decline in the market price of our common stock could cause our stockholders to lose some or all of their investment and may adversely impact our ability to attract and retain employees and raise capital. There can no assurance that in the future, the market price of our common stock will not be impacted by similar events.

Table of Contents

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws and applicable Delaware law may prevent or discourage third parties or our stockholders from attempting to replace our management or influencing significant decisions.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws may have the effect of delaying or preventing a change in control of us or our management, even if doing so would be beneficial to our stockholders. These provisions include:

dividing our board of directors into three classes serving staggered three-year terms;

authorizing our board of directors to issue preferred stock without stockholder approval;

prohibiting stockholder actions by written consent;

limiting the persons who may call special meetings of stockholders;

prohibiting our stockholders from making certain changes to our certificate of incorporation or bylaws except with 66²/₃% stockholder approval; and

requiring advance notice for raising business matters or nominating directors at stockholders' meetings.

We are also subject to provisions of the Delaware corporation law that, in general, prohibit any business combination with a beneficial owner of 15% or more of our common stock for three years unless the holder's acquisition of our stock was approved in advance by our board of directors. Together, these charter and statutory provisions could make the removal of management more difficult and may discourage transactions that otherwise could involve payment of a premium over prevailing market prices for our common stock.

Our principal stockholders and management own a significant percentage of our outstanding common stock and will be able to exercise significant influence over our affairs.

Our executive officers, current directors and holders of five percent or more of our common stock, as of March 3, 2008, beneficially owned approximately 56.7% of our common stock based on the SEC's rules for determining beneficial ownership. These stockholders will likely be able to determine the composition of our board of directors, retain the voting power to approve all matters requiring stockholder approval and continue to have significant influence over our operations. The interests of these stockholders may be different than the interests of other stockholders on these matters. This concentration of ownership could also have the effect of delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could reduce the price of our common stock.

ITEM 1B. UNRESOLVED STAFF COMMENTS

None.

ITEM 2. PROPERTIES

We lease an approximately 18,500 square foot facility in San Diego, California for our headquarters and for our research and development, and manufacturing activities. This lease expires September 30, 2008. We have also leased a small facility in Cologne, Germany, which was the headquarters of our wholly-owned subsidiary, CryoCor GmbH which we have now closed. We have vacated this facility as of June 30, 2006, and we are in discussions with the landlord about terminating this lease. We believe that our current United States facility will be sufficient to meet our needs for the foreseeable future.

Table of Contents

ITEM 3. LEGAL PROCEEDINGS

In 2004, we requested that the USPTO institute interference proceedings between two patents owned by CryoCath Technologies and two of our CryoGen-licensed applications relating to certain primary and pre-cooling refrigeration system designs. In January 2008, the USPTO determined that one of our applications claimed rights to the same technology claimed by CryoCath, and declared an interference in which we were named the senior party. The purpose of the interference proceedings is to determine which company was the first to invent, and therefore has the rights to, the interfering subject matter. As the senior party, we are the presumed inventor of the technology and the burden of proof is placed on CryoCath to demonstrate an earlier date of invention. We believe we have an earlier date of invention, however, if we are not successful in these proceedings, we could fail to gain rights to certain patent claims.

In October 2007, CryoCath asserted a number of their patents covering both catheter and console technologies against us in the District Court of Delaware. We anticipate that this action will take between two and three years to resolve and that it will be costly for us to defend our position. We believe that the development and marketing of our cryoablation system for the treatment of AFL and AF does not infringe any valid and enforceable claim of the asserted CryoCath United States patents and, in certain circumstances, we have obtained written opinions from outside patent counsel regarding the invalidity of a number of CryoCath's patents and/or their non-infringement by our cryoablation system. There can be no assurance, however, that we will successfully defend the actions initiated by CryoCath and, if we are found to infringe any of their valid patents, it would materially harm our business.

In January 2008, we brought patent infringement actions against CryoCath, asserting a number of our CryoGen-licensed patents covering both catheter and console technologies. We initially asserted our patents in district courts in Delaware and Canada, and have subsequently asked the United States International Trade Commission, or ITC, to investigate CryoCath for illegal importation of products that infringe our intellectual property. We believe these combined actions may be an effective method of defending our intellectual property portfolio. The ITC action, in particular, is important because a successful action may block CryoCath's importation of infringing products into the United States. In 2008, in response to our action, CryoCath countersued in the District Court of Delaware, adding claims against us including infringement of an additional patent, anti-trust, and unfair competition claims. We do not believe these additional claims have merit, but we will be required to defend against this countersuit, and if CryoCath is successful with any of these claims, it would materially harm our business.

ITEM 4. SUBMISSION OF MATTERS TO A VOTE OF SECURITY HOLDERS

No matters were submitted to a vote of our stockholders, through the solicitation of proxies or otherwise, during the quarter ended December 31, 2007.

Table of Contents**PART II****ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY SECURITIES**

We had our initial public offering on July 13, 2005, and sold 3,709,090 shares of common stock at \$11 per share. Prior to such time there was no public market for our common stock. Our common stock is currently traded on the Nasdaq Stock Market, or Nasdaq, under the symbol CRYO .

The following table sets forth the high and low sales prices per share of our common stock for the quarterly periods indicated as reported on Nasdaq which correspond to our quarterly fiscal periods for financial reporting purposes.

	2007	
	High(\$)	Low(\$)
Common Stock		
First Quarter	7.35	2.41
Second Quarter	7.20	2.31
Third Quarter	5.93	3.00
Fourth Quarter	4.58	2.79

	2006	
	High(\$)	Low(\$)
Common Stock		
First Quarter	5.99	2.10
Second Quarter	3.35	1.28
Third Quarter	3.44	1.25
Fourth Quarter	3.50	1.40

On March 3, 2008, the closing price of our common stock on Nasdaq was \$1.90 per share. As of March 14, 2008, there were 12,732,680 shares of common stock outstanding held by approximately 167 holders of record.

Dividends

We have never paid or declared any cash dividends on its common stock and we do not anticipate paying any cash dividends on our common stock in the foreseeable future. The terms of our senior secured credit facilities entered into in June 2007 restrict our ability to declare or pay dividends. We intend to retain future earnings, if any, to fund our growth. Any future payment of dividends to our stockholders will depend on decisions that will be made by our board of directors and will depend on then existing conditions, including our financial condition, contractual restrictions, capital requirements and business prospects.

Use of Proceeds

Our first Registration Statements on Form S-1 (Reg. Nos. 333-123841 and 333-126582), as amended, relating to our initial public offering were declared effective by the SEC on July 13, 2005. The offering commenced the same day and 3,709,090 shares of common stock were sold on our behalf at \$11.00 per share, for an aggregate offering price of \$40.8 million. Following the sale of shares, the offering was terminated. The net offering proceeds to us, after deducting underwriting discounts and commissions and estimated offering expenses, were approximately \$35.4 million.

We invested \$35.4 million in proceeds from the offering, net of underwriting discounts and commissions and offering expenses, in money market funds, United States government or corporate bond securities, and asset-backed securities. Through September 30, 2007, we used all of the proceeds from our initial public offering for research and development activities, clinical trial activities, expenses related to our facility, manufacturing and

Table of Contents

quality system operations, sales and marketing activities, the pay-off of our \$7.0 million debt facility in June 2007, and for working capital and general corporate purposes.

The foregoing payments were direct payments made to third parties who were not our directors or officers (or their associates), persons owning ten percent or more of any class of our equity securities or any other affiliate, except that a portion of the proceeds used for general corporate purposes included regular compensation for our officers and directors.

Performance Graph

The following performance graph illustrates a comparison of total cumulative stockholder return on our common stock since July 13, 2005, the date of our initial public offering, to two indices: (i) the Center for Research in Security Prices, or CRSP, Total Return Index for the Nasdaq Stock Market and (ii) a peer group industry index based on the standard industrial code for surgical medical and dental instruments and supplies, or the Peer Group Index. The graph assumes an initial investment of \$100 on July 13, 2005 and that all dividends have been reinvested. No cash dividends have been declared on our common stock. The comparisons in the graph are required by the SEC and are not intended to forecast or be indicative of possible future performance of our common stock.

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

This Management's Discussion and Analysis of Financial Condition and Results of Operations should be read in conjunction with the consolidated financial statements, including related notes, appearing elsewhere in this Annual Report on Form 10-K for the year ended December 31, 2007.

Overview

We have developed and manufacture a minimally invasive system based on our proprietary cryoablation technology for the treatment of cardiac arrhythmias. Cardiac arrhythmias are dysfunctions in the electrical activity of the heart that normally controls and maintains the highly coordinated contractions of the heart. Arrhythmias cause the heart to pump blood less efficiently, cause potentially debilitating symptoms and can result in life threatening events such as stroke. We have focused our initial development efforts on designing a system for treating atrial fibrillation, or AF, and right atrial flutter, or AFL, the two most common and difficult to treat arrhythmias. AF is the most prevalent arrhythmia and AFL is the second most prevalent arrhythmia and can lead to, and often coexists with, AF.

In August 2007, we received approval of our application for premarket approval, or PMA, from the United States Food and Drug Administration, or FDA, for the treatment of AFL with our CryoCor Cardiac Cryoablation System, or cryoablation system. We are in the process of building our sales and marketing capabilities, and have recently hired a Vice President of Sales and Marketing and several sales representatives. Our first commercial sales of our cryoablation catheters for the treatment of AFL in the United States occurred in the fourth quarter of 2007 and we have shipped a limited number of cryoablation catheters and consoles to new commercial sites. To date, our commercial efforts have been focused on converting our clinical trial sites to begin doing commercial cases, and seeking new commercial sites that have either never used cryoablation at all, or that have not used CryoCor's cryoablation system and are interested in evaluating our system. We do not expect that we will generate a significant level of revenues until we expand our installed base of consoles and we are approved for the treatment of AF, if at all. There can be no assurance that we will ever generate a significant level of revenues.

In August 2007, we completed the enrollment of our pivotal trial for the treatment of AF and believe that we are the first company to complete the enrollment of a randomized pivotal trial for the treatment of AF. In September 2007, we were invited by the FDA to present our experience to an Advisory Panel convened by the FDA to discuss the status of atrial fibrillation pivotal trials. During this Advisory Panel, we discussed our experience in completing enrollment of the AF pivotal trial, and certain members of the Advisory Panel noted our successful efforts in completing enrollment in the pivotal trial. We believe this Advisory Panel was an important meeting as the Advisory Panel recommended to the FDA that it maintain the existing requirement for randomized clinical trial designs, and commented on the use of different methodologies for evaluating the success of ablation therapy, based upon current clinical practice. We believe that, in addition to those specified in the clinical trial protocol, the FDA will consider these different methodologies which we will present in our analysis of our clinical trial data. Based upon the anticipated time required to follow our patients subsequent to their cryoablation treatments, we anticipate that we will file a PMA for the treatment of AF in 2008, that this PMA will be reviewed by an Advisory Panel to the FDA and that a decision from the FDA on whether or not to approve our cryoablation system for the treatment of AF will be made in 2009. There can be no assurance that the FDA will determine to approve our cryoablation system for the treatment of AF, and there can be no assurance that we will be the first company to file a PMA for the treatment of AF.

In June 2007, we signed a development and license agreement with Boston Scientific Corporation, or BSC, under which we agreed to modify our existing console to run a cryoablation balloon catheter developed by BSC. Under the terms of a second separate agreement, Boston Scientific Scimed, Inc., or BSS, made an equity investment and has made development milestone payments as we have achieved specified development milestones over the course of the collaboration. We have completed the first four milestones of the development

Table of Contents

agreement, and expect to complete our final milestones and receive the final milestone payments in the second quarter of 2008. We will receive royalties from BSC upon the commercial sales of the BSC balloon catheter and upon the sale of any consoles by BSC, if any such sales occur.

Our product, the cryoablation system, is designed to treat cardiac arrhythmias through the use of extreme cold, or cryoenergy, to ablate, or destroy, targeted cardiac cells. Unlike radiofrequency, or RF, and other heat-based ablation technologies, which can destroy both the targeted cardiac cells and the extracellular material that binds the cells together, cryoablation leaves the material surrounding the cardiac cells fully intact. As a result, cryoablation may reduce the occurrence and severity of complications observed with heat-based ablation technologies. Our cryoablation system utilizes our proprietary technology that allows it to generate, deliver and transfer high levels of cryoenergy enabling large lesion sizes, shorter procedure times and enhanced system versatility. We believe these advantages provide better therapeutic efficacy and give us a greater ability to treat the more complex arrhythmias, such as AF and AFL, than competing cryoablation technologies. We believe our cryoablation system eliminates or reduces many of the drawbacks and risks associated with surgical and other heat-based ablation procedures.

We are currently selling our products in the United States, where we have received FDA approval of our cryoablation system for the treatment of AFL, and in Europe, where we have been approved for the treatment of all supraventricular tachycardias, including AF and AFL. In the United States, we are commercializing with a direct CryoCor sales force, and may enter into a co-marketing relationship with a marketing partner in the future. We have recently hired a Vice President of Sales and Marketing to lead our efforts to commercialize our product in the United States. However, our ability to build and install our planned base of cryoablation consoles and to hire the additional sales and support personnel necessary to support this installed base will be impacted by our available financial resources, and we may not hire additional sales and support personnel or make the capital expenditures necessary to achieve these objectives unless we are able to raise additional financing on satisfactory terms. We do not anticipate generating significant product revenues until we obtain FDA marketing approval of our cryoablation system for the treatment of AF. We market our cryoablation system in Europe through European distributors, and our products are sold in the United Kingdom, Germany, Denmark, Belgium, the Netherlands and Italy. In the near term, we do not intend to sign additional distribution agreements in Europe and we may never sign additional distribution agreements.

We are currently involved in a series of complex intellectual property legal actions against CryoCath Technologies Inc., or CryoCath, our only cryoablation competitor that has a cryoablation product approved for sale in the United States. These actions include offensive patent infringement actions we have brought in district courts in Delaware and Canada, an interference proceeding requested by us and declared by the United States Patent and Trademark Office, a defensive patent infringement action filed against us in the district court of Delaware, and a complaint we have brought before the United States International Trade Commission. The initial phases of these actions will take anywhere from one to three years to conclude and will be costly for us to prosecute. There can be no assurance that we will prevail in any or all of these actions.

To date, we have generated minimal revenues and we have incurred net losses in each year since our inception. We expect these losses to continue as we continue to engage in our legal actions against CryoCath, complete our clinical trial and file our PMA for the treatment of AF and continue to develop our product candidates, and for at least the next several years after our commercial launch in the United States for the treatment of AFL. We have financed our operations primarily through private placements of common stock and preferred stock, convertible promissory notes, bank debt, and the proceeds of our initial public offering completed in July 2005, which raised aggregate net proceeds of \$35.4 million. In addition, in April 2007, we completed a private placement of our common stock which raised aggregate gross proceeds of \$5.5 million, and in June 2007, we sold \$2.5 million in common stock to BSS.

Table of Contents

Going Concern

As more fully described in the Risk Factors and Note 1 of the Notes to Financial Statements, our independent registered public accounting firm has included an explanatory paragraph in their report on our 2007 financial statements related to the uncertainty of our ability to continue as a going concern. At December 31, 2007, we had \$12.3 million in cash, cash equivalents and short-term investments, and we expect to receive an additional \$4.0 million under our existing BSC collaboration. We believe these cash resources will be sufficient to meet our anticipated cash requirements until the fourth quarter of 2008, and therefore we will need to raise additional financing to continue operations beyond such time. We may not be able to complete a debt or equity financing on terms that are favorable to us, or at all, and if we are unable to obtain sufficient financing, we may be required to reduce or discontinue our operations and may not be able to continue as a going concern.

Financial Operations

Product Revenues. Our product revenues to date have mainly come from a limited number of commercial sites in Europe, and from our initial efforts to begin selling into the United States, for the treatment of AFL. To date, we have not generated substantial revenues in Europe as our financial resources have primarily been dedicated to product development and clinical trials in the United States. This has prevented us from providing the resources necessary to broadly market our cryoablation system in Europe and from increasing the number of consoles placed in Europe. In October 2007, we began selling catheters for our cryoablation system in the United States for the treatment of AFL, and our initial commercial efforts have been focused on converting the hospitals that participated in our clinical trials to now be commercial accounts. We do not anticipate generating significant product revenues until we obtain FDA marketing approval of our cryoablation system for the treatment of AF. For the foreseeable future, we expect that any revenues we generate from sales of our products for the treatment of AFL will fluctuate from quarter-to-quarter.

Research and Development Expenses. Our research and development expenses primarily consist of costs incurred to further our research and development activities and include salaries and related employee benefits, non-cash share-based compensation, costs associated with clinical trials, pre-clinical activities, regulatory activities, research-related overhead expenses, fees paid to external service providers and fees paid under contracts with research organizations, which conduct certain research and development activities on our behalf. We expense research and development costs as they are incurred.

Selling, General and Administrative Expenses. Our selling, general and administrative expenses consist primarily of cash compensation and non-cash share-based compensation for executive, finance and administrative personnel. Other significant costs include professional fees for accounting and legal services, including legal services associated with our efforts to obtain and maintain protection for the intellectual property related to our cryoablation system.

Results of Operations

We anticipate that our results of operations will fluctuate for the foreseeable future due to several factors, such as the progress of our research and development efforts, the timing and outcome of regulatory submissions, and quarterly variations in sales activities and results. We also anticipate that we will continue to incur net losses for the next several years. Due to these uncertainties, results of future operations are difficult to predict.

Years Ended December 31, 2007, 2006 and 2005

Product Revenue and Collaboration Revenue. Our product revenues were \$258,000 in 2007, \$540,000 in 2006 and \$843,000 in 2005. The majority of our product revenue was generated from the sale of our products in Europe as FDA approval of our cryoablation system to treat right atrial flutter was not obtained until August 2007. The \$282,000, or 52%, decrease and the \$303,000, or 36%, decrease in product sales from 2006 to 2007 and 2005 to 2006, respectively, were due to the closure of our European subsidiary in mid-2006 and our decision

Table of Contents

to sell our European products solely through our network of distributors, which is at a reduced price compared to selling products directly to end customers.

Deferred revenue increased from \$78,000 at December 31, 2006 to \$206,000 at December 31, 2007 due primarily to an advance payment of \$500,000 received against development milestones under our development and license agreement with BSC, of which \$167,000 remains deferred at December 31, 2007. We are recognizing the advance payment over the expected development period of the contract, and expect full recognition of the advance payment by March 31, 2008. As of December 31, 2007, we had \$39,000 of deferred revenue related to product shipped to customers that has not yet met our revenue recognition criteria.

Collaboration revenue increased to \$333,000 for the year ended December 31, 2007 from \$0 for the year ended December 31, 2006 due to the partial recognition of an advance payment received under our development and license agreement with BSC.

Cost of Sales. Our cost of sales was \$2.7 million in 2007, \$2.5 million in 2006 and \$3.1 million in 2005. Cost of sales primarily consists of materials, labor and overhead costs associated with the manufacturing and warranty of our products. The increase in costs of sales from 2006 to 2007 was mainly due to higher headcount needed as a result of the increase in product manufacturing. The decrease in cost of sales from 2005 to 2006 was related to lower headcount costs due to our staff restructuring in March 2006 as well as reduced sales volumes in 2006. If our products are successfully commercialized, we anticipate that our cost of sales as a percentage of revenues will decline as we achieve higher future volumes of product sales. Included in cost of sales for the years ended December 31, 2007, 2006 and 2005 were non-cash share-based compensation of \$431,000, \$411,000 and \$277,000, respectively.

Research and Development Expenses. Our research and development expenses were \$7.4 million in 2007, \$5.8 million in 2006 and \$7.5 million in 2005. The \$1.6 million, or 27%, increase from 2006 to 2007 was primarily related to the costs associated with our FDA Advisory Panel meeting for our PMA for the treatment of AFL and related regulatory consulting of \$276,000, costs related to our third-party clinical research organization of \$403,000, costs related to the research and development efforts under the BSC development and license agreement and the Quantum development project of \$382,000, increased preclinical research of \$225,000, increased non-cash share-based compensation of \$185,000, as well as increased compensation expense for bonus expense related to our FDA Advisory Panel meeting and subsequent approval of our cryoablation system for the treatment of AFL and our employee retention program of \$503,000. These increases were partially offset by lower clinical trial costs of \$261,000 related to lower enrollment in our ongoing AF clinical trial than enrollment in the year ended December 31, 2006. The \$1.7 million, or 23%, decrease from 2005 to 2006 was primarily due to slower patient enrollment in 2006 versus 2005 for the AF pivotal trial as well as costs incurred in 2005 associated with the filing of our PMA for atrial flutter. Included in research and development expenses for the years ended December 31, 2007, 2006 and 2005 were non-cash share-based compensation of \$682,000, \$497,000 and \$770,000, respectively.

Selling, General and Administrative Expenses. Our selling, general and administrative expenses were \$6.1 million in 2007, \$7.4 million in 2006 and \$6.9 million in 2005. The \$1.3 million, or 17%, decrease from 2006 to 2007 was primarily due to lower personnel costs, including severance, as a result of our staff restructuring in early 2006 of \$491,000, lower operating costs associated with the closure of CryoCor GmbH in mid-2006 of \$849,000, and lower non-cash share-based compensation of \$570,000. These decreases were partially offset by higher legal costs of \$666,000 and recruiting costs associated with the search for our Vice President of Sales and Marketing of \$120,000. The \$442,000, or 6%, increase from 2005 to 2006 was primarily due to an increase in non-cash share-based compensation of \$371,000. Included in selling, general and administrative expenses for the years ended December 31, 2007, 2006 and 2005 were non-cash share-based compensation of \$849,000, \$1.4 million and \$1.0 million, respectively.

Interest Income. Our interest income was \$883,000 in 2007, \$1.1 million in 2006 and \$634,000 in 2005. The fluctuation in interest income directly relates to the balance of short-term investments throughout those years.

Table of Contents

The short-term investment balance was affected by our credit facility and equity transactions during 2007 and our mid-year initial public offering in 2005.

Interest Expense. Our interest expense was \$993,000 in 2007, \$1.1 million in 2006 and \$1.0 million in 2005. Our 2007, 2006 and 2005 interest expense includes \$726,000, \$788,000 and \$621,000, respectively, related to our \$7.0 million debt facility that was paid off in June 2007 and our \$6.0 million credit facility entered into during June 2007. In addition, our 2007, 2006 and 2005 interest expense also included \$208,000, \$286,000 and \$227,000, respectively, in non-cash interest expense from the amortization of the debt discount recorded on warrants related to our debt and credit facilities.

Liquidity and Capital Resources

We have incurred losses since our inception in August 2000. As of December 31, 2007, we had an accumulated deficit of \$100.8 million. We have funded our operations to date from public and private placements of equity and debt securities, as well as bank debt, for aggregate net cash proceeds of \$105.0 million through December 31, 2007.

As of December 31, 2007, we had debt outstanding of \$6.0 million (excluding debt discount for warrants of \$323,000, respectively), working capital of \$5.2 million and cash, cash equivalents and short-term investments totaling \$12.3 million. We currently invest our cash in money market funds, United States government or corporate bond securities and asset-backed securities.

In June 2007, we entered into a loan and security agreement that provided us with a \$14.0 million credit facility, as evidenced by secured promissory notes. We paid off our previous outstanding \$7.0 million debt facility in full prior to entering into the agreement. The credit facility is available in two draws, with the first draw of \$6.0 million received in June 2007, and the second draw of \$8.0 million available for borrowing after the occurrence of both of the following conditions: (i) approval is received from the FDA of our application for pre-market approval for the treatment of right atrial flutter with the CryoCor Cardiac Cryoablation System (which occurred in August 2007), and (ii) we receive unrestricted net cash proceeds of at least \$20.0 million from the closing of an equity financing. Upon the applicable drawdown, we will make interest-only payments for the first six months following each advance, and will then make principal payments to fully amortize the advance over the subsequent 30-month term. The loan bears interest at a rate of 11.77% per annum. The loan provides that the credit facility is secured by our assets, excluding intellectual property. Pursuant to the terms of the loan and security agreement, we are subject to a material adverse change clause, which permits the holder of the note to call the balance if a material adverse change occurs. A material adverse change is defined as, (i) a material impairment in the perfection or priority of lenders' lien in the collateral or in the value of such collateral; (ii) a material adverse change in our business, operations, or condition (financial or otherwise); or (iii) a material impairment of the prospect of repayment of any portion of the obligations. Due to our current financial condition, we have classified the entire principal balance as current although the contractual payment structure requires us to make monthly payments through July 2010.

Based upon our current planned level of expenditures, we believe that our cash, cash equivalents and short-term investments on hand, together with cash flows from operating activities and the collection of the remaining funds under the BSC collaboration will be adequate to meet our anticipated cash requirements for working capital until the fourth quarter of 2008.

Net Cash Provided by (Used in) Operating Activities. Net cash used in operating activities increased \$1.8 million to \$14.0 million for the year ended December 31, 2007, compared to \$12.2 million for the year ended December 31, 2006. The net cash used in both of these periods primarily reflects the net loss for each period, offset in part by depreciation and amortization, non-cash share-based compensation, amortization of debt discount and changes in operating assets and liabilities.

Table of Contents

Net Cash Used in Investing Activities. Net cash provided by investing activities increased \$2.8 million to \$7.3 million for the year ended December 31, 2007, compared to \$4.4 million for the year ended December 31, 2006. Cash provided by (used in) investing activities mainly relates to purchases and maturities of short-term investments as well as purchases and disposals of property and equipment. The increase in net cash used in investing activities for the year ended December 31, 2007 is due to the overall use of cash during the year and the resulting lower short-term investment balance at December 31, 2007 as compared to the balance at December 31, 2006.

Net Cash Provided by Financing Activities. Net cash provided by financing activities increased \$6.7 million to \$6.9 million for the year ended December 31, 2007, compared to \$256,000 for the year ended December 31, 2006. Net cash provided by financing activities during the year ended December 31, 2007 was primarily attributable to \$5.3 million in net proceeds from the April 2007 private placement of our common stock, \$2.5 million in net proceeds from a common stock purchase agreement with Boston Scientific Scimed, Inc. in June 2007 and a new \$6.0 million credit facility entered into during June 2007. The net proceeds from these three transactions were partially offset by the payoff of an existing debt facility of \$7.0 million. Net cash provided by financing activities during the year ended December 31, 2006 was primarily attributable to proceeds from the issuance of common stock related to the exercise of stock options granted under our equity incentive plans.

Operating Capital and Capital Expenditure Requirements

To date, we have had limited commercial sales in Europe and in the United States and we have not yet achieved profitability. We anticipate that we will continue to incur net losses for the next several years as we continue to engage in our litigation with CryoCath, develop our products, continue our clinical programs, expand our corporate infrastructure and commercially launch our cryoablation system in the United States for the treatment of AF, if approved. We expect that we will need to generate significant product revenues to achieve profitability.

We do not expect to generate significant product revenues until we obtain FDA marketing approval of our cryoablation system for the treatment of AF. Even though the FDA recently approved our PMA for the treatment of AFL, we do not anticipate broadly commercializing our cryoablation system until we have secured additional financing on satisfactory terms. Our ability to build and install our planned base of cryoablation consoles and to hire the additional sales and support personnel necessary to support this installed base will be impacted by our available financial resources, and we may not hire additional sales and support personnel or make the capital expenditures necessary to achieve these objectives unless we are able to raise additional financing on satisfactory terms. Based upon our planned level of expenditures, we believe that our existing funds, including the expected collection of the remaining \$4.0 million from our collaboration with BSC, will be adequate to meet our anticipated cash requirements until the fourth quarter of 2008, and in order to continue to fund our operations beyond that date, we will need to seek additional financing. We expect to sell additional equity or debt securities or obtain an additional credit facility, or to access the additional funds available under our existing credit facility, to increase our financial resources. The sale of additional equity and convertible debt securities will result in additional dilution to our stockholders. If we raise additional funds through the issuance of convertible debt securities, these securities would have rights senior to those of our common stock and could contain covenants that would restrict our operations. We may require additional capital beyond our currently forecasted amounts. Any such required additional capital may not be available on reasonable terms, if at all. If we are unable to obtain additional financing, we may be required to reduce the scope of, delay or eliminate some or all of our planned clinical and commercial activities, and research and development efforts, or to cease operations.

As a condition to the FDA approving our PMA for AFL, we agreed to sponsor a post-market registry study of our cryoablation system. In this registry study, we will collect safety and effectiveness data over a one-year follow-up period on our cryoablation system for the treatment of AFL in 325 patients. We will also collect safety and effectiveness data over a one-year period on competing RF ablation systems for the treatment of AFL in 325 patients. The compliance requirements for a company sponsoring a registry study are less complex than a

Table of Contents

pre-market clinical study, and we believe that we will be able to collect the required safety and effectiveness data without significant difficulty. We anticipate that the external cost of conducting the post-market registry study will be between \$1.0 million and \$1.5 million and will be incurred over a multi-year period. We intend to begin the registry study in the second half of 2008.

On February 21, 2006, we issued a press release announcing that we implemented a restructuring plan intended to reduce our burn rate and to permit us to finance ourselves with our then existing cash, cash equivalents and short-term investments until December 2007. The decision to implement a restructuring plan was in response to a communication that we received from the FDA informing us that our PMA for the treatment of AFL using our cryoablation system was not approvable at that time based on the data we submitted.

The restructuring plan included a reduction in our workforce which resulted in severance-related costs of \$280,000, including benefits. We also incurred \$50,000 in restructuring expense associated with terminating various sales and marketing associated contracts. In total, we incurred \$330,000 in costs associated with the restructuring plan, which was completed during July 2006.

In August 2006, we created an incentive compensation program for our non-executive full-time employees. Under the terms of the program, employees that remained with the Company through August 31, 2007 would receive a payment of 20% of their 2006 annual salary. The incentive payments and related employer taxes and fees were paid on August 31, 2007 and totaled \$520,000. We have continued this program, and made payments of 5% of annual salary in December 2007, and anticipate making payments of 15% of our non-executive full-time employees' 2007 annual salaries in 2008; however, we are evaluating the circumstances and criteria under which the employees would be eligible to receive this 15% payment in 2008. Additionally, at the end of August 2006, we did not extend our employment agreement with our former Chief Executive Officer, Gregory Ayers. Under the terms of his employment agreement, he received separation compensation of one year's salary, or \$450,000, over the 12 months subsequent to his departure. As of September 30, 2007, all of the amounts due had been paid. In February 2008, we amended our employment agreement with our current CMO. Under the amended employment agreement, if she elects to terminate her employment with us for any reason between April 30, 2008 and May 31, 2008, we would pay her one year's salary, or \$250,000, over the twelve months subsequent to her election to terminate her employment.

At present, we have a wholly owned subsidiary in Germany that previously sold our products in Germany, Belgium, and the Netherlands. We discontinued the activities of this subsidiary in 2006 and are currently pursuing the dissolution of this subsidiary. We incurred restructuring charges of \$252,000 in conjunction with the closing of our subsidiary, of which \$30,000 remains accrued at December 31, 2007. We have signed distribution agreements for the sale of our cryoablation system in the United Kingdom and Italy, and our United Kingdom distributor supports our customers in Germany, Belgium, Denmark and the Netherlands. In the near term, we do not intend to sign additional distribution agreements in Europe and we may never sign additional distribution agreements. In the United States, we are commercializing with a direct CryoCor sales force and may enter into a co-marketing relationship with a marketing partner in the future. We have recently hired a Vice President of Sales and Marketing to lead our efforts to commercialize our product in the United States. However, our ability to build and install our planned base of cryoablation consoles and to hire the additional sales and support personnel necessary to support this installed base will be impacted by our available financial resources, and we may not hire additional sales and support personnel or make the capital expenditures necessary to achieve these objectives unless we are able to raise additional financing on satisfactory terms. Even though the FDA recently approved our PMA for the treatment of AFL and we have begun selling our cryoablation system in the United States for the treatment of AFL, we do not anticipate generating significant product revenues until we obtain FDA marketing approval of our cryoablation system for the treatment of AF.

We anticipate spending at least a total of \$2.0 million in external costs during 2008 and 2009 for existing clinical trials and regulatory activities related to using our cryoablation system to treat AF, and an anticipated clinical trial for our next generation catheter, Quantum. In addition, we anticipate spending an additional \$1.0 million \$1.5 million on the registry study required by the FDA as a condition for approval for our cryoablation

Table of Contents

system for the treatment of AFL. We believe that our remaining cash and cash equivalents will be used to prosecute and maintain our intellectual property portfolio, including in connection with our litigation with CryoCath, to fund our facility, to maintain our manufacturing and quality system operations and to fund our working capital and general corporate requirements during this same period.

In 2004, we requested that the USPTO institute interference proceedings between two patents owned by CryoCath Technologies and two of our CryoGen-licensed applications relating to certain primary and pre-cooling refrigeration system designs. In January 2008, the USPTO determined that one of our applications claimed rights to the same technology claimed by CryoCath, and declared an interference in which we were named the senior party. The purpose of the interference proceedings is to determine which company was the first to invent, and therefore has the rights to, the interfering subject matter. As the senior party, we are the presumed inventor of the technology and the burden of proof is placed on CryoCath to demonstrate an earlier date of invention. We believe we have an earlier date of invention, however, if we are not successful in these proceedings, we could fail to gain rights to certain patent claims. We believe the external cost associated with these interference proceedings will be between \$1.5 million \$2.0 million over a two year period.

In October 2007, CryoCath asserted a number of their patents covering both catheter and console technologies against us in the District Court of Delaware. We anticipate that this action will take between two and three years to resolve and that it will be costly for us to defend our position. We believe that the development and marketing of our cryoablation system for the treatment of AFL and AF does not infringe any valid and enforceable claim of the asserted CryoCath United States patents and, in certain circumstances, we have obtained written opinions from outside patent counsel regarding the invalidity of a number of CryoCath's patents and/or their non-infringement by our cryoablation system. There can be no assurance, however, that we will successfully defend the actions initiated by CryoCath and, if we are found to infringe any of their valid patents, it would materially harm our business. We believe the external cost associated with defending this lawsuit will be between \$2.0 million and \$2.5 million over a three year period.

In January 2008, we brought patent infringement actions against CryoCath, asserting a number of our CryoGen-licensed patents covering both catheter and console technologies. We initially asserted our patents in district courts in Delaware and Canada, and have subsequently asked the United States International Trade Commission, or ITC, to investigate CryoCath for illegal importation of products that infringe our intellectual property. We believe these combined actions may be an effective method of defending our intellectual property portfolio. The ITC action, in particular, is important because a successful action may block CryoCath's importation of infringing products into the United States. In 2008, in response to our action, CryoCath countersued in the District Court of Delaware, adding claims against us including infringement of an additional patent, anti-trust, and unfair competition claims. We do not believe these additional claims have merit, but we will be required to defend against this countersuit. We believe the external cost associated with pursuing these various legal actions will be between \$6.0 million \$7.0 million over a three year period.

Our forecasts of the period of time through which our financial resources will be adequate to support our operations and the costs to complete clinical trials, post-market registry studies and development of products, as well as to engage in our litigation with CryoCath, are forward-looking statements and involve risks and uncertainties, and actual results could vary as a result of a number of factors, including the factors discussed in the Risk Factors section of this Form 10-K, and in our other securities filings filed with the Securities and Exchange Commission, or SEC. We have based these estimates on assumptions that may prove to be wrong, and we may be required to utilize our available capital resources sooner than we currently expect.

Our future funding requirements will depend on many factors, including, but not limited to:

the costs of defending and enforcing our patent portfolio and other intellectual property rights, including in connection with our litigation with CryoCath;

the commercial acceptance of our product in the United States, including after we initiate sales efforts targeting AF, if ever;

Table of Contents

the costs of establishing sales, marketing and distribution capabilities;

our ability to obtain FDA approval for the treatment of AF or other regulatory approval for our products;

the scope, rate of progress and cost of our clinical trials and other research and development activities;

the costs and timing of seeking regulatory approvals, including participation in FDA advisory panel meetings and performing any required additional studies or trials;

clinical trial results;

acceptance by the FDA of our clinical trial design and data to support applications for marketing approval of the desired indications;

the extent and level of reimbursement for cryoablation;

the effect of competing products and technologies; and

the terms and timing of any collaborative, licensing and other arrangements that we may establish.

Future capital requirements will also depend on the extent to which we acquire or invest in other businesses, products and technologies, but, other than our development and license agreement with BSC, we currently have no commitments or agreements relating to any of these types of transactions.

We have service agreements with clinical sites, individuals and institutional research organizations for the conduct of our AF pivotal trial. We make payments to these sites and organizations based upon the actual number of patients enrolled and the period of follow-up in the trials, and we have accrued approximately \$590,000 in fees and expenses through December 31, 2007 in connection with our AF pivotal trial. We do not have minimum payment obligations under these agreements and the amount to be paid to each center and the timing of those payments will vary based on the negotiated amount paid for each patient to be treated and for each patient screened who fails to or declines to participate in the clinical trial. We anticipate that the external cash outlay of completing our AF pivotal trial and submitting a PMA for the treatment of AF with our cryoablation system will be approximately \$1.4 million during 2008. In addition to the \$1.4 million in external cash outlay, we expect to incur additional expenses in connection with the preparation of our regulatory filings, including costs associated with employees and consultants, as well as related legal expenses.

We have agreed to cover the treatment costs for certain patients in our AF pivotal trial who are either not insured, or who are insured but were declined coverage by their insurance company for the costs associated with our procedure. As of December 31, 2007, we have agreed to cover the treatment costs for 10 patients at an estimated cost of approximately \$223,000, of which \$117,000 is included in the accrued clinical development liabilities on our balance sheet at December 31, 2007. We anticipate that we may pay the treatment costs for up to three additional cryoablation treatments for these 10 uninsured or underinsured patients. We project that if we cover these costs, the additional estimated cost of these treatments would be \$12,000 to \$35,000 each. The total estimated costs for covering the costs of these treatments are included in our estimated \$1.4 million above.

Contractual Obligations. The following table summarized our outstanding contractual obligations as of December 31, 2007:

Payments due in

Edgar Filing: CRYOCOR INC - Form 10-K

	Total	Less than 1 Year	1-3 Years	3-5 Years	More than 5 Years
Operating leases	\$ 293,000	\$ 290,000	\$ 3,000	\$	\$
Debt facility	6,000,000	6,000,000			

Table of Contents

The table above reflects only payment obligations that are fixed and determinable. Our commitments for operating leases primarily relate to the lease for our headquarters in San Diego, California. In November 2006, we renewed this lease through September 2008, and the table above includes the payments of approximately \$27,000 per month that will be due pursuant to the terms of the lease.

In June 2007, we entered into a loan and security agreement, or Loan Agreement, with Oxford Finance Corporation, ATEL Ventures, Inc. and Silicon Valley Bank, or the Lenders, that provides us with a \$14.0 million credit facility, as evidenced by secured promissory notes. The credit facility is available in two draws, with the first draw of \$6.0 million received in June 2007, and the second draw of \$8.0 million available for borrowing after the occurrence of both of the following conditions: (i) approval is received from the FDA of our application for pre-market approval for the treatment of right atrial flutter with the CryoCor Cardiac Cryoablation System (which occurred in August 2007), and (ii) we receive unrestricted net cash proceeds of at least \$20.0 million from the closing of an equity financing. Upon the applicable drawdown, we will make interest-only payments for the first six months following each advance, and will then make principal payments to fully amortize the advance over the subsequent 30-month term. This loan bears interest at a rate of 11.77% per annum. The Loan Agreement provides that the credit facility is secured by our assets, excluding intellectual property.

Pursuant to the terms of the Loan Agreement, we are subject to a material adverse change clause, which permits the holder of the note to call the balance if a material adverse change occurs. A material adverse change is defined as, (i) a material impairment in the perfection or priority of Lenders' lien in the collateral or in the value of such collateral; (ii) a material adverse change in our business, operations, or condition (financial or otherwise); or (iii) a material impairment of the prospect of repayment of any portion of the obligations. Due to our current financial condition, we have classified the entire principal balance as current although the contractual payment structure requires us to make monthly payments through July 2010.

Obligation under an Off-Balance Sheet Arrangement

In June 2007, we entered into the Loan Agreement that provided us with a \$14.0 million credit facility, as evidenced by secured promissory notes. The credit facility is available in two draws, with the first draw of \$6.0 million received in June 2007, and the second draw of \$8.0 million available for borrowing after the occurrence of both of the following conditions: (i) approval is received from the FDA of our application for pre-market approval for the treatment of right atrial flutter with the CryoCor Cardiac Cryoablation System (which occurred in August 2007), and (ii) we receive unrestricted net cash proceeds of at least \$20.0 million from the closing of an equity financing. Upon the applicable drawdown, we will make interest-only payments for the first six months following each advance, and will then make principal payments to fully amortize the advance over the subsequent 30-month term. The loan bears interest at a rate of 11.77% per annum. The Loan Agreement provides that the credit facility is secured by our assets, excluding intellectual property.

If certain events of default occur and continue, including our failure to pay obligations under the Loan Agreement, our violation of certain covenants or if we become insolvent, Silicon Valley Bank, on behalf of itself and the other Lenders, may declare all amounts we owe under the Loan Agreement immediately due and payable.

Critical Accounting Policies and Significant Judgments and Estimates

Our management's discussion and analysis of our financial condition and results of operations is based on our consolidated financial statements, which have been prepared in accordance with United States generally accepted accounting principles. The preparation of these financial statements requires us to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements as well as the reported revenues and expenses during the reporting periods. On an ongoing basis, we evaluate our estimates and judgments. We base our estimates on historical experience and on various other factors that we believe are reasonable under the circumstances, the results of which form the basis for making judgments about the carrying value of assets and liabilities that are

Table of Contents

not readily apparent from other sources. Actual results may differ from these estimates under different assumptions or conditions.

We believe that the following accounting policies and estimates are most critical to a full understanding and evaluation of our reported financial results.

Revenue Recognition

We comply with SEC Staff Accounting Bulletin No. 104, *Revenue Recognition in Financial Statements*, or SAB 104, and the Financial Accounting Standards Board, or FASB, Statement of Financial Accounting Standards No. 48, or SFAS 48, *Revenue Recognition When Right of Return Exists*. SAB 104 and SFAS 48 set forth guidelines on the timing of revenue recognition based upon factors such as passage of title, installation, payment terms and ability to return products. We recognize revenue when all of the following criteria are met: (i) persuasive evidence that an arrangement exists; (ii) delivery of the products and/or services has occurred; (iii) the selling price is fixed or determinable; (iv) collectibility is reasonably assured; and (v) the ability to return the product has expired.

Historically, customers had the right to return catheter and sheath products until one month following the expiration date of the product, which had been six months after production. Effective October 1, 2006, the catheter and sheath products expire one year and two years after production, respectively. Therefore, we modified our return policy such that we will no longer grant a right to return products for other than warranty purposes. As we have had limited sales of our products, we currently recognize revenues when the customer has paid for the product and, if applicable, the right of return, if any, has expired.

As we begin selling our products in the United States for the treatment of AFL and if they gain market acceptance and our sales volumes increase, we will monitor our shipments, returns, maintenance costs and bad debts. Eventually, we anticipate recording revenues upon shipment, accruing estimated warranty costs and estimated returns as a reduction of revenue upon shipment and accruing bad debts as a selling, general and administrative cost.

Revenue from a milestone achievement is recognized when earned, as evidenced by acknowledgment from our collaborator, provided that (i) the milestone event is substantive and its achievability was not reasonably assured at the inception of the agreement, (ii) the milestone represents the culmination of an earnings process, (iii) the milestone payment is non-refundable and (iv) our performance obligations after the milestone achievement will continue to be funded by our collaborator at a level comparable to the level before the milestone achievement. If all of these criteria are not met, the milestone achievement is recognized over the remaining minimum period of our performance obligations under the agreement. We defer non-refundable upfront fees under our collaborations and recognize them over the period in which we have significant involvement or perform services, using various factors specific to each collaboration. Amounts we receive for research funding for a specified number of full-time researchers are recognized as revenue as the services are performed. Advance payments we receive in excess of amounts earned are classified as deferred revenues until earned.

Clinical Trial Expenses

Clinical trial costs are a component of research and development expenses and include fees paid to participating hospitals and other service providers which conduct clinical trial activities with patients on our behalf. The various costs of the trial are contractually based on the nature of the service and we accrue the costs as the services to the patient are provided.

Table of Contents*Share-Based Payments*

We have four share-based compensation plans consisting of three stock option programs and an employee stock purchase plan. Prior to January 1, 2006, we accounted for these plans under the recognition and measurement provisions of APB Opinion No. 25, *Accounting for Stock Issued to Employees*, or APB 25, and related guidance, as permitted by Statement of Financial Accounting Standards No. 123, *Accounting for Stock-Based Compensation*, or SFAS 123. Effective January 1, 2006, we adopted the fair value recognition provisions of the Statement of Financial Accounting Standards No. 123 (revised 2004), *Share-Based Payment*, or SFAS 123(R), as interpreted by the SEC's Staff Accounting Bulletin No. 107, or SAB 107, using the prospective method and the modified prospective method. Therefore, we have not restated our financial results for prior periods.

In accordance with SFAS 123(R), we utilized the prospective method for stock options granted prior to our initial public offering as we had used the minimum value method of measuring the fair value of these options for pro forma disclosure purposes under SFAS 123. Therefore, unless modified in the future, these options are excluded from the adoption of SFAS 123(R). We utilized the modified prospective method for stock options granted subsequent to our initial public offering as we had used the fair-value-based method of measuring the fair value of these options for pro forma disclosure purposes under SFAS 123. Under these transition methods, compensation cost recognized during the year ended December 31, 2006 included the following: (a) share-based compensation cost associated with options granted prior to our initial public offering with exercise prices less than the deemed fair value of the common stock at the date of grant, (b) compensation cost related to any share-based payments granted subsequent to the date of our initial public offering through, but not vested as of, December 31, 2005, and (c) compensation cost for any share-based payments granted subsequent to December 31, 2005, based on the grant-date fair value estimated in accordance with the provisions of SFAS 123(R).

During 2004 and the first half of 2005, prior to the completion of our initial public offering, stock options were granted at exercise prices that were below the deemed fair value of the common stock on the date of grant. Accordingly, deferred stock compensation was recorded into stockholders' equity during 2004 and 2005 in accordance with APB 25. The deferred stock compensation was being amortized on a straight-line basis over the vesting period of the related awards, which is generally four years. In accordance with SFAS 123(R), we eliminated the balance of deferred compensation against paid in capital on the date of adoption of SFAS 123(R) but, as noted above, continue to recognize the related compensation expense in the statement of operations.

As a result of adopting SFAS 123(R), we recognized additional share-based employee compensation expense of \$815,000 and \$510,000 during the years ended December 31, 2007 and 2006, respectively in addition to \$976,000 and \$1.8 million in compensation expense recorded as required under APB 25, respectively. We calculated this expense based on the fair values of the share-based compensation awards as estimated using the Black-Scholes option valuation model. Use of this model requires us to make assumptions about expected future volatility of our stock price and the expected term of the options that we grant. Calculating share-based compensation expense under SFAS 123(R) also requires us to make assumptions about expected future forfeiture rates for our option awards. As of December 31, 2007, total unrecognized compensation expense related to unvested share-based compensation arrangements already granted under our various plans was \$3.7 million, which we expect will be recognized over a weighted-average period of 1.6 years. However, it is difficult to predict the actual amount of share-based compensation expense that we will recognize in future periods because that expense can be affected by changes in the amount or terms of our share-based compensation awards issued in the future, changes in the assumptions used in our model to value those future awards, changes in our stock price, and changes in interest rates, among other factors.

We issue stock options to non-employees, generally for services, which we account for under the provisions of SFAS 123 and Emerging Issues Task Force Abstract No. 96-18, *Accounting for Equity Instruments That Are Issued to Other Than Employees for Acquiring, or in Conjunction with Selling, Goods or Services*. These stock options are valued using the Black-Scholes option valuation model and are subject to periodic adjustment as the underlying options vest. Changes in fair value are amortized over the vesting period on a straight-line basis.

Table of Contents

Income Taxes

In July 2006, the FASB issued Interpretation No. 48, *Accounting for Uncertainty in Income Taxes - An Interpretation of FASB Statement No. 109*, or FIN 48, which clarifies the accounting for uncertainty in income taxes recognized in an entity's financial statements in accordance with SFAS No. 109. Under FIN 48, the impact of an uncertain income tax position on the income tax return must be recognized at the largest amount that is more-likely than-not to be sustained upon audit by the relevant taxing authority. An uncertain income tax position will not be recognized if it has 50% or less likelihood of being sustained upon examination. Additionally, FIN 48 provides guidance on derecognition, classification, interest and penalties, accounting in interim periods, disclosure and transition. For public companies, FIN 48 became effective for fiscal years beginning after December 15, 2006.

We adopted the provisions of FIN 48 on January 1, 2007. There were no unrecognized tax benefits as of the date of adoption. As a result of the implementation of FIN 48, we did not recognize an increase in the liability for unrecognized tax benefits. There are no unrecognized tax benefits included in the balance sheet that would, if recognized, affect the effective tax rate.

We record a full valuation allowance to reduce our deferred tax assets to the amount that is more likely than not to be realized. While we have considered future taxable income and ongoing prudent and feasible tax planning strategies in assessing the need for the valuation allowance, in the event we were to determine that we would be able to realize our deferred tax assets in the future in excess of its net recorded amount, an adjustment to the deferred tax asset would increase income in the period such determination was made. For additional information regarding the adoption of FIN 48 and for further discussion of our critical accounting estimates related to income taxes, see Note 8, Income Taxes.

Recent Accounting Pronouncements

In September 2006, the FASB issued Statement of Financial Accounting Standards No. 157, *Fair Value Measurements*, or SFAS 157. SFAS 157 provides guidance for using fair value to measure assets and liabilities. It also responds to investors' requests for expanded information about the extent to which companies measure assets and liabilities at fair value, the information used to measure fair value, and the effect of fair value measurements on earnings. SFAS 157 applies whenever other standards required (or permit) assets or liabilities to be measured at fair value, and does not expand the use of fair value in any new circumstances. SFAS 157 is effective for financial statements issued for fiscal years beginning after November 15, 2007. We are currently evaluating the effect that the adoption of SFAS 157 will have on our consolidated results of operations and financial condition and we are not yet in a position to determine such effects.

In February 2007, the FASB issued Statement of Financial Accounting Standards No. 159, *The Fair Value Option for Financial Assets and Financial Liabilities - Including an amendment of FASB Statement No. 115*, or SFAS 159. SFAS 159 expands the use of fair value accounting but does not affect existing standards that require assets or liabilities to be carried at fair value. Under SFAS 159, a company may elect to use fair value to measure accounts and loans receivable, available-for-sale and held-to-maturity securities, equity method investments, accounts payable, guarantees and issued debt. Other eligible items include firm commitments for financial instruments that otherwise would not be recognized at inception and non-cash warranty obligations where a warrantor is permitted to pay a third party to provide the warranty goods or services. If the use of fair value is elected, any upfront costs and fees related to the item must be recognized in earnings and cannot be deferred, such as debt issuance costs. The fair value election is irrevocable and generally made on an instrument-by-instrument basis, even if a company has similar instruments that it elects not to measure based on fair value. At the adoption date, unrealized gains and losses on existing items for which fair value has been elected are reported as a cumulative adjustment to beginning retained earnings. Subsequent to the adoption of SFAS 159, changes in fair value are recognized in earnings. SFAS 159 is effective for fiscal years beginning after November 15, 2007 and is required to be adopted by the Company in the first quarter of fiscal 2008.

Table of Contents

We are currently determining whether fair value accounting is appropriate for any of the eligible items and cannot estimate the impact, if any, that SFAS 159 will have on our consolidated results of operations and financial condition.

In June 2007, the Emerging Issue Task Force, or EITF, issued EITF Issue No. 07-3, *Accounting for Nonrefundable Advance Payments for Goods or Services to be Used in Future Research and Development Activities*, or EITF 07-3. The consensus requires companies to defer and capitalize prepaid, nonrefundable research and development payments to third parties over the period that the research and development activities are performed or the services are provided, subject to an assessment of recoverability. EITF 07-3 is effective for new contracts entered into in fiscal years beginning after December 15, 2007, including interim periods within those fiscal years. We do not expect the adoption of EITF 07-3 to have a material impact on our financial statements.

ITEM 7A. QUANTITATIVE AND QUALITATIVE DISCLOSURES ABOUT MARKET RISK

The primary objective of our investment activities is to preserve our capital for the purpose of funding operations while at the same time maximizing the income we receive from our investments without significantly increasing risk. To achieve these objectives, our investment policy allows us to maintain a portfolio of cash equivalents and short-term investments in a variety of securities, including commercial paper, money market funds, government and corporate debt securities and asset-backed securities. Our cash, cash equivalents and short-term investments as of December 31, 2007 included liquid money market funds, commercial paper, United States government debt securities, corporate debt securities and asset-backed securities. Due to the short-term nature of our investments, we believe that there is no material exposure to interest rate risk.

We have some activities in foreign currencies, principally our commercial efforts in Europe, which are denominated in euros. We do not currently use derivative financial instruments to mitigate this exposure. However, we do not expect fluctuations in foreign exchange rates to have a material impact on our financial condition or results of operations.

Table of Contents

ITEM 8. FINANCIAL STATEMENTS AND SUPPLEMENTARY DATA

See the list of financial statements filed with this Annual Report on Form 10-K under Item 15 below.

ITEM 9. CHANGES IN AND DISAGREEMENTS WITH ACCOUNTANTS ON ACCOUNTING AND FINANCIAL DISCLOSURE

None.

ITEM 9A (T). CONTROLS AND PROCEDURES

Disclosure Controls and Procedures

We maintain disclosure controls and procedures that are designed to ensure that information required to be disclosed in our periodic reports filed with the SEC are recorded, processed, summarized and reported within the time periods specified in the rules and forms of the SEC and that such information is accumulated and communicated to our management, including our chief executive officer and chief financial officer, as appropriate, to allow for timely decisions regarding required disclosure. In designing and evaluating the disclosure controls and procedures, management recognizes that any controls and procedures, no matter how well designed and operated, can provide only reasonable assurance of achieving the desired control objectives, and no evaluation of controls and procedures can provide absolute assurance that all control issues and instances of fraud, if any, within a company have been detected. Management is required to apply its judgment in evaluating the cost-benefit relationship of possible controls and procedures.

Management's Report on Internal Control over Financial Reporting

As required by Rule 13a-15(b) of the Exchange Act, prior to filing this Annual Report on Form 10-K, we carried out an evaluation, under the supervision and with the participation of our management, including our chief executive officer and chief financial officer, of the effectiveness of the design and operation of our disclosure controls and procedures (as defined in Rules 13a-15(e) and 15d-15(e) of the Exchange Act) as of the end of the period covered by this Annual Report on Form 10-K. Based on their evaluation, our chief executive officer and chief financial officer concluded that our disclosure controls and procedures were effective as of the end of the period covered by this Annual Report on Form 10-K.

This Annual Report on Form 10-K does not include an attestation report of our registered public accounting firm regarding internal control over financial reporting. Management's report was not subject to attestation by our registered public accounting firm pursuant to temporary rules of the SEC that permit us to provide only management's report in this Annual Report on Form 10-K.

Changes in Internal Control over Financial Reporting

An evaluation was also performed under the supervision and with the participation of our management, including our chief executive officer and chief financial officer, of any change in our internal control over financial reporting that occurred during our last fiscal quarter and that has materially affected, or is reasonably likely to materially affect, our internal control over financial reporting. That evaluation did not identify any change in our internal control over financial reporting that occurred during our latest fiscal quarter that has materially affected, or is reasonably likely to materially affect, our internal control over financial reporting.

ITEM 9B. OTHER INFORMATION

None.

Table of Contents**PART III****ITEM 10. DIRECTORS, EXECUTIVE OFFICERS AND CORPORATE GOVERNANCE**

The information required by this Item 10 is incorporated herein by reference to our Proxy Statement to be filed with the SEC within 120 days after December 31, 2007 for our Annual Meeting of Stockholders to be held on May 8, 2008.

ITEM 11. EXECUTIVE COMPENSATION

The information required by this Item 11 is incorporated herein by reference to our Proxy Statement to be filed with the SEC within 120 days after December 31, 2007 for our Annual Meeting of Stockholders to be held on May 8, 2008.

ITEM 12. SECURITY OWNERSHIP OF CERTAIN BENEFICIAL OWNERS AND MANAGEMENT AND RELATED STOCKHOLDER MATTERS**Equity Compensation Plan Information**

The following table provides information as of December 31, 2007 with respect to compensation plans under which our common stock is authorized for issuance.

Plan Category	Number of securities to be issued upon exercise of outstanding options	Weighted-average exercise price of outstanding options	Number of securities remaining available for future issuance under equity compensation plans
Equity compensation plans approved by security holders	1,662,522	\$2.59	236,544(1)
Total	1,662,522	\$2.59	236,544

- (1) Includes 139,437 shares of our common stock available for issuance under our 2005 Employee Stock Purchase Plan as of December 31, 2007. Excludes future increases in the number of shares reserved for issuance pursuant to the terms of the 2005 Equity Incentive Plan, the 2005 Non-Employee Directors Stock Option Plan and the 2005 Employee Stock Purchase Plan.

Additional information required by this Item 12 is incorporated by reference to our Proxy Statement to be filed with the SEC within 120 days after December 31, 2007 for our Annual Meeting of Stockholders to be held on May 8, 2008.

ITEM 13. CERTAIN RELATIONSHIPS AND RELATED TRANSACTIONS AND DIRECTOR INDEPENDENCE

The information required by this Item 13 is incorporated herein by reference to our Proxy Statement to be filed with the SEC within 120 days after December 31, 2007 for our Annual Meeting of Stockholders to be held on May 8, 2008.

ITEM 14. PRINCIPAL ACCOUNTANT FEES AND SERVICES

The information required by this Item 14 is incorporated herein by reference to our Proxy Statement to be filed with the SEC within 120 days after December 31, 2007 for our Annual Meeting of Stockholders to be held on May 8, 2008.

The Board of Directors and Stockholders

CryoCor, Inc.

We have audited the accompanying consolidated balance sheets of CryoCor, Inc. as of December 31, 2007 and 2006, and the related consolidated statements of operations, stockholders' equity and cash flows for each of the three years in the period ended December 31, 2007. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. We were not engaged to perform an audit of the Company's internal control over financial reporting. Our audits included consideration of internal control over financial reporting as a basis for designing audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's internal control over financial reporting. Accordingly, we express no such opinion. An audit also includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, assessing the accounting principles used and significant estimates made by management, and evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the consolidated financial statements referred to above present fairly, in all material respects, the consolidated financial position of CryoCor, Inc. at December 31, 2007 and 2006, and the consolidated results of its operations and its cash flows for each of the three years in the period ended December 31, 2007, in conformity with U.S. generally accepted accounting principles.

As described in Note 1 of the notes to consolidated financial statements, effective January 1, 2006 the Company changed its method of accounting for share-based payments as required by the provisions of Statement of Financial Accounting Standards No. 123 (revised 2004), *Share-Based Payment*.

The accompanying financial statements have been prepared assuming that CryoCor, Inc. will continue as a going concern. As more fully described in Note 1, CryoCor, Inc. has an accumulated deficit of \$100.8 million and has working capital of \$5.2 million. These conditions raise substantial doubt about the Company's ability to continue as a going concern. Management's plans in regard to these matters also are described in Note 1. The financial statements do not include any adjustments to reflect the possible future effects on the recoverability and classification of assets or the amounts and classification of liabilities that may result from the outcome of this uncertainty.

CryoCor, Inc.

Notes to Consolidated Financial Statements

Note 1. Organization and Summary of Significant Accounting Policies

Organization

CryoCor, Inc. (CryoCor or the Company) a Delaware corporation, is a medical technology company that has developed and manufactures a minimally invasive, disposable catheter system based on proprietary cryoablation technology for the treatment of cardiac arrhythmias.

In 2001, the Company established a wholly owned German subsidiary, CryoCor GmbH, in order to market and support the Company's products in the European community. In 2002, the Company received European regulatory approval for the commercial sale of the Company's products. In November 2005, the Company announced its intention to close CryoCor GmbH and sell its products in Europe solely through European distributors. See Note 3 for further details on the closure of the subsidiary.

Basis of Presentation

The Company has a history of recurring losses from operations and has an accumulated deficit of \$100.8 million as of December 31, 2007. As of December 31, 2007, the Company had available cash, cash equivalents and short-term investments totaling \$12.3 million and working capital of \$5.2 million. Additionally, the Company will require additional cash funding to execute against its strategic plan for 2008. These factors raise substantial doubt about the Company's ability to continue as a going concern. Successful completion of the Company's development program and its transition to attaining profitable operations is dependent upon obtaining additional financing adequate to fulfill its research and development activities and achieving a level of revenue adequate to support its cost structure. The Company does not have sufficient working capital to fund its planned operations through December 31, 2008; therefore, it is actively seeking additional debt or equity financing. There can be no assurances that there will be adequate financing available to the Company. If the Company cannot obtain sufficient additional financing in the short-term, the Company may be forced to restructure or significantly curtail the Company's operations, file for bankruptcy or cease operations. The accompanying consolidated financial statements have been prepared assuming that the Company will continue as a going concern. This basis of accounting contemplates the recovery of the Company's assets and the satisfaction of liabilities in the normal course of business. The consolidated financial statements do not include any adjustments to reflect the possible future effects on the recoverability and classification of assets or the amounts and classification of liabilities that may result from the outcome of this uncertainty.

Principles of Consolidation

The consolidated financial statements include the accounts of the Company and CryoCor GmbH. All intercompany accounts and transactions have been eliminated in consolidation.

Foreign Currency Translation and Transactions

The financial statements of CryoCor GmbH are measured using the euro as the functional currency. For purposes of consolidation, the assets and liabilities of this subsidiary are translated at the rate of exchange at the balance sheet date. Income and expense items are translated at the average daily rate of exchange during the reporting period. Resulting measurement gains or losses are recognized as a component of other comprehensive income. With the exception of long-term advances from CryoCor, which are denominated in United States dollars and are considered long-term investments in nature, transactions denominated in currencies other than the local currency are recorded based on exchange rates at the time such transactions arise. Subsequent changes in exchange rates result in transaction gains and losses, which are reflected in income as unrealized (based on period-end translations) or realized upon settlement of the transaction. Transaction gains or losses were not material for the years ended December 31, 2007, 2006 and 2005.

CryoCor, Inc.

Notes to Consolidated Financial Statements (Continued)

Use of Estimates

The preparation of financial statements in conformity with United States generally accepted accounting principles requires management to make estimates and assumptions that affect the amount reported in the financial statements and accompanying notes. Actual results could differ from those estimates.

Impairment of Long-Lived Assets

In accordance with Financial Accounting Standard Board (FASB) Statement of Financial Accounting Standard (SFAS) No. 144, *Accounting for the Impairment of Disposable Long-Lived Assets*, the Company will record impairment losses on long-lived assets used in operations when events and circumstances indicate that assets might be impaired and the undiscounted cash flows estimated to be generated by those assets are less than the carrying amount of those assets. While the Company's current and historical operating losses and cash flows are indicators of impairment, the Company believes the future cash flows to be received support the carrying value of its long-lived assets and accordingly, the Company has not recognized any impairment losses through December 31, 2007.

Revenue Recognition

The Company complies with the Securities and Exchange Commission's (SEC) Staff Accounting Bulletin (SAB) No. 104, *Revenue Recognition in Financial Statements* (SAB 104), and SFAS No. 48, *Revenue Recognition When Right of Return Exists* (SFAS 48). SAB 104 and SFAS 48 set forth guidelines on the timing of revenue recognition based upon factors such as passage of title, installation, payment terms and ability to return products. The Company recognizes revenue when all of the following criteria are met: (i) persuasive evidence that an arrangement exists; (ii) delivery of the products and/or services has occurred; (iii) the selling price is fixed or determinable; (iv) collectibility is reasonably assured; and (v) the ability to return the product has expired.

The Company has three principal products that can be sold to customers, specifically the console that generates the cryoenergy, a disposable catheter that delivers the cryoenergy to the target site, and a disposable sheath that helps position the catheter. While the Company may sell consoles in the future, its current revenues are generated by the sales of catheters and sheaths, with catheters comprising approximately 95%, 95% and 93% of the 2007, 2006 and 2005 product revenues, respectively.

The Company's current European customers do not typically purchase consoles and the Company's current business practice in Europe is to loan consoles free of charge to medical centers to stimulate sales of disposable products. The Company does not intend to reclaim the consoles; however, the Company retains the right to do so in the event it becomes dissatisfied with the medical center's use of the console. The Company has not modified the pricing of its disposable catheters to recover the cost of its consoles. Therefore, there is no revenue attributable to its consoles and, accordingly, the consoles are expensed upon shipment to the customer. In the event the Company elects to sell consoles in the future, the Company does not intend to offer a right of return on the consoles.

Historically, customers had the right to return catheter and sheath products until one month following the expiration date of the product, which had been six months after production. Effective October 1, 2006, the catheter and sheath products expire one year and two years after production, respectively. Therefore, the Company modified its return policy such that the Company will no longer grant a right to return products for other than warranty purposes. As the Company has had limited sales of its products, it currently recognizes revenues when the customer has paid for the product and the right of return, if any, has expired.

Table of Contents

CryoCor, Inc.

Notes to Consolidated Financial Statements (Continued)

As the Company begins selling its products in the United States for the treatment of AFL and if they gain market acceptance and our sales volumes increase, the Company will monitor our shipments, returns, maintenance costs and bad debts. Eventually, the Company anticipates recording revenues upon shipment, accruing estimated warranty costs and estimated returns as a reduction of revenue upon shipment and accruing bad debts as a selling, general and administrative cost.

Revenue from a milestone achievement is recognized when earned, as evidenced by acknowledgment from the Company's collaborator, provided that (i) the milestone event is substantive and its achievability was not reasonably assured at the inception of the agreement, (ii) the milestone represents the culmination of an earnings process, (iii) the milestone payment is non-refundable and (iv) our performance obligations after the milestone achievement will continue to be funded by the Company's collaborator at a level comparable to the level before the milestone achievement. If all of these criteria are not met, the milestone achievement is recognized over the remaining minimum period of our performance obligations under the agreement. The Company defers non-refundable upfront fees under its collaborations and recognize them over the period in which they have significant involvement or perform services, using various factors specific to each collaboration. Amounts they receive for research funding for a specified number of full-time researchers are recognized as revenue as the services are performed. Advance payments the Company receives in excess of amounts earned are classified as deferred revenues until earned.

Research and Development

Research and development expenses primarily consist of costs incurred to further the Company's research and development activities and include salaries and related employee benefits, including non-cash share-based compensation, costs associated with clinical trials, pre-clinical activities, regulatory activities, research-related overhead expenses, fees paid to external service providers and fees paid under contracts with research organizations, which conduct certain research and development activities on behalf of the Company. Research and development costs are expensed as incurred.

Clinical Trial Expenses

Clinical trial costs are a component of research and development expenses and include fees paid to participating hospitals and other service providers which conduct clinical trial activities with patients on behalf of the Company. The various costs of the trial are contractually based on the nature of the service and the Company accrues the costs as the services to the patient are provided.

Inventories

Inventories are carried at the lower of cost or market using the first-in, first-out method. The Company began capitalizing inventory costs associated with the manufacture of medical equipment after receiving European regulatory approval to initiate the commercial sale of the Company's products in 2002. Costs capitalized include raw materials and subcontract conversion costs associated with the manufacture and assembly of the Company's medical products.

Property and Equipment

Property and equipment are stated at cost. Depreciation and amortization of the Company's assets are calculated using the straight-line method over an estimated useful life ranging from three to five years, or the lease term, as appropriate. Leasehold improvements are amortized over the estimated useful life or the lease term, whichever is shorter.

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)****Share-Based Payments***Adoption of SFAS 123(R)*

Effective January 1, 2006, the Company adopted the fair value recognition provisions of the SFAS No. 123 (revised 2004), *Share-Based Payment* (SFAS 123(R)) as interpreted by the SEC's SAB No. 107 (SAB 107), using the prospective method and the modified prospective method. Therefore, the Company did not restate its financial results for prior periods. In accordance with SFAS 123(R), the Company utilized the prospective method for stock options granted prior to its initial public offering as the Company had used the minimum value method of measuring the fair value of these options for pro forma disclosure purposes under SFAS No. 123, *Accounting for Stock-Based Compensation* (SFAS 123). Therefore, unless modified in the future, these options are excluded from the adoption of SFAS 123(R). The Company utilized the modified prospective method for stock options granted subsequent to its initial public offering as the Company had used the fair-value-based method of measuring the fair value of these options for pro forma disclosure purposes under SFAS 123. Under these transition methods, compensation cost recognized during the year ended December 31, 2007 and 2006 included the following: (a) share-based compensation cost associated with options granted prior to the Company's initial public offering with exercise prices less than the deemed fair value of the common stock at the date of grant, (b) compensation cost related to any share-based payments granted subsequent to the date of the Company's initial public offering through, but not vested as of, December 31, 2005, and (c) compensation cost for any share-based payments granted subsequent to December 31, 2005, based on the grant-date fair value estimated in accordance with the provisions of SFAS 123(R).

During 2004 and the first half of 2005, prior to the completion of the Company's initial public offering, 1,194,366 stock options were granted to employees at exercise prices that were below the deemed fair value of the common stock on the date of grant. Accordingly, deferred stock compensation was recorded into stockholders' equity during 2004 and 2005 in accordance with Accounting Principles Board Opinion No. 25, *Accounting for Stock Issued to Employees*, and related interpretations (APB 25). The deferred stock compensation was being amortized on a straight-line basis over the vesting period of the related awards, which is generally four years. During the year ended December 31, 2005, amortization of deferred stock compensation was \$2.0 million. In accordance with SFAS 123(R), the Company eliminated the remaining \$5.0 million balance of deferred compensation against paid in capital on the date of adoption of SFAS 123(R) but, as noted above, continues to recognize the related compensation cost in the statement of operations.

Share-Based Compensation Costs under FAS123(R) for the Years Ended December 31, 2007 and 2006

The compensation costs that have been recognized on our statement of operations for employee and non-employee director share-based compensation arrangements were as follows (in thousands):

	Year ended December 31, 2007	Year ended December 31, 2006
Share-based employee compensation costs included in:		
Cost of sales	\$ 423	\$ 400
Research and development	591	492
Selling, general, and administrative	777	1,378
Total share-based employee compensation costs	1,791	2,270
Income tax benefit recognized		
Impact on net loss	\$ 1,791	\$ 2,270

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

As a result of adopting SFAS 123(R), the Company recognized share-based employee compensation expense of \$815,000 and \$510,000 during the years ended December 31, 2007 and 2006, in addition to \$976,000 and \$1.8 million in compensation expense recorded as required under APB 25, respectively. These amounts are all included in the table above.

The amount of share-based compensation associated with the cost of production is not significant; therefore, the Company did not capitalize any share-based compensation cost as part of inventory during the year ended December 31, 2007 or for any prior periods.

There were no significant modifications to the Company's share-based employee payment plans during the periods presented that resulted in any incremental compensation cost.

Pro Forma Information under FAS123 for the Year Ended December 31, 2005

Prior to January 1, 2006, the Company accounted for its share-based compensation plans under the recognition and measurement provisions of APB 25, as permitted by SFAS 123, as amended by SFAS 148, *Accounting for Stock-Based Compensation*. Prior to the adoption of SFAS 123(R), the Company provided pro forma net loss and pro forma net loss per common share disclosures for share-based awards, as if the fair-value-based method defined in SFAS 123 had been applied. The table below illustrates the pro forma effect on net loss and net loss per share attributable to common stockholders if the Company had applied the fair value provisions of SFAS 123 to options granted under its share-based employee compensation arrangements during the year ended December 31, 2005 (in thousands, except per share amounts):

	Year ended December 31, 2005
Net loss attributable to common stockholders, as reported	\$ (19,860)
Add: Share-based employee compensation expense included in loss from operations	1,954
Deduct: Share-based employee compensation expense determined under fair value method	(31)
Pro forma net loss attributable to common stockholders	\$ (17,937)
Basic and diluted net loss per share attributable to common stockholders	\$ (3.96)
Pro forma basic and diluted net loss per share attributable to common stockholders	\$ (3.58)

For purposes of this pro forma disclosure, the Company estimated the value of the stock options using the Black-Scholes option valuation model and amortized that value to expense over the stock options' vesting periods. The Company allocated this fair value to the pro forma compensation expense using the straight-line attribution method. Per the requirements of SFAS 123(R), the deduction of share-based compensation expense in the above table excludes all stock option grants historically valued using the minimum value method. Therefore, the table above does not include any information related to the first half of 2005, as all options granted prior to the Company's July 2005 initial public offering were valued using the minimum value method.

Valuation of Stock Option Awards

Prior to the Company's initial public offering, the fair value for each option grant was determined using the minimum value method. Since the completion of the initial public offering in July 2005, the fair value of each option award is estimated on the date of grant using the Black-Scholes option valuation model that uses the assumptions noted in the following table. Expected volatilities are based on historical volatility of the Company's stock as well as the stock of comparable medical device companies. As permitted by SAB 107, the Company

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

utilized the shortcut approach to estimate the stock options' expected term, which represents the period of time that options are expected to be outstanding. The Company utilized this approach as it believes its historical share option exercise experience does not provide a reasonable basis upon which to estimate an expected term. The risk-free interest rate for the expected term of the option is based on the United States Treasury yield curve in effect at the time of grant. No dividend yield was assumed as the Company has not paid dividends to date and has no intention to do so in the near future.

As share-based compensation expense recognized in the financial statements under SFAS 123(R) is based on awards that are ultimately expected to vest, it is reduced for estimated forfeitures. SFAS 123(R) requires forfeitures to be estimated at the time of grant and revised, if necessary, in subsequent periods if actual forfeitures differ from those estimates. Forfeitures were estimated to be 4% for stock options granted during 2007 and 2006 based upon historical forfeitures.

	Years ended December 31,		
	2007	2006	2005
Expected volatility	89%	78%	0% 70%
Expected term	5.97 years	5.72 years	6 years
Risk-free interest rate	4.63%	4.75%	3.52%
Expected dividends	0%	0%	0%

Comprehensive Loss

Comprehensive income is defined as the change in equity of a business enterprise during a period from transactions and other events and circumstances from non-owner sources, including foreign currency translation adjustments and unrealized gains and losses on marketable securities. The Company presents comprehensive income in its consolidated statements of stockholders' equity.

Fair Value of Financial Instruments

Financial instruments, including cash and cash equivalents, accounts payable and accrued liabilities are carried at cost, which management believes approximates fair value given their short-term nature. Based on the borrowing rates currently available to the Company for loans with similar terms, management believes the fair value of the long-term debt approximates its carrying value.

Recently Issued Accounting Standards

In September 2006, the FASB issued Statement of Financial Accounting Standards No. 157, *Fair Value Measurements*, or SFAS 157. SFAS 157 provides guidance for using fair value to measure assets and liabilities. It also responds to investors' requests for expanded information about the extent to which companies measure assets and liabilities at fair value, the information used to measure fair value, and the effect of fair value measurements on earnings. SFAS 157 applies whenever other standards required (or permit) assets or liabilities to be measured at fair value, and does not expand the use of fair value in any new circumstances. SFAS 157 is effective for financial statements issued for fiscal years beginning after November 15, 2007. The Company is currently evaluating the effect that the adoption of SFAS 157 will have on its consolidated results of operations and financial condition and is not yet in a position to determine such effects.

In February 2007, the FASB issued Statement of Financial Accounting Standards No. 159, *The Fair Value Option for Financial Assets and Financial Liabilities Including an amendment of FASB Statement No. 115*, or SFAS 159. SFAS 159 expands the use of fair value accounting but does not affect existing standards that require assets or liabilities to be carried at fair value. Under SFAS 159, a company may elect to use fair value to measure

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

accounts and loans receivable, available-for-sale and held-to-maturity securities, equity method investments, accounts payable, guarantees and issued debt. Other eligible items include firm commitments for financial instruments that otherwise would not be recognized at inception and non-cash warranty obligations where a warrantor is permitted to pay a third party to provide the warranty goods or services. If the use of fair value is elected, any upfront costs and fees related to the item must be recognized in earnings and cannot be deferred, such as debt issuance costs. The fair value election is irrevocable and generally made on an instrument-by-instrument basis, even if a company has similar instruments that it elects not to measure based on fair value. At the adoption date, unrealized gains and losses on existing items for which fair value has been elected are reported as a cumulative adjustment to beginning retained earnings. Subsequent to the adoption of SFAS 159, changes in fair value are recognized in earnings. SFAS 159 is effective for fiscal years beginning after November 15, 2007 and is required to be adopted by the Company in the first quarter of fiscal 2008. The Company is currently determining whether fair value accounting is appropriate for any of the eligible items and cannot estimate the impact, if any, that SFAS 159 will have on the Company's consolidated results of operations and financial condition.

Note 2. Net Loss per Common Share

Basic net loss per share attributable to common stockholders is calculated by dividing the net loss attributable to common stockholders by the weighted-average number of common shares outstanding for the period, without consideration for common stock equivalents. Diluted net loss per share attributable to common stockholders is computed by dividing the net loss attributable to common stockholders by the weighted-average number of common share equivalents outstanding for the period determined using the treasury-stock method. For purposes of this calculation, common stock subject to repurchase by the Company, redeemable convertible preferred stock, convertible preferred stock, stock options and warrants are considered to be common stock equivalents and are only included in the calculation of diluted net loss per share when their effect is dilutive.

	2,419	1,412	1,169

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)****Note 3. Balance Sheet Information*****Cash and Cash Equivalents***

The Company considers all highly-liquid investments purchased with an original maturity of three months or less to be cash equivalents. As of December 31, 2007, the Company's cash and cash equivalents were held in financial institutions in the United States and consist of deposits in money market funds and asset-backed commercial paper, which were unrestricted as to withdrawal or use.

Investment Securities

Investment securities generally consist of corporate debt securities and asset-backed securities. The Company classifies all securities as available-for-sale, as the sale of such securities may be required prior to maturity to implement management strategies. These securities are carried at fair value, with the unrealized gains and losses reported as a component of other comprehensive income (loss) until realized. Realized gains and losses from the sale of available-for-sale securities, if any, are determined on a specific identification basis. A decline in the market value below cost of any available-for-sale security that is determined to be other than temporary results in a revaluation of its carrying amount to fair value and an impairment charge to earnings, resulting in a new cost basis for the security. No such impairment charges were recorded for the periods presented. As of December 31, 2007, the Company owned no auction rate securities.

Premiums and discounts are amortized or accreted over the life of the related security as an adjustment to yield using the straight-line method. The amortization and accretion, interest income and realized gains and losses are included in interest income within the Consolidated Statements of Operations. Interest income is recognized when earned.

As of December 31, 2007 and 2006, the contractual maturity of all investment securities was less than one year. The composition of investments and gross unrealized gains and losses at December 31, 2007 and 2006 were as follows (in thousands):

	December 31, 2007			December 31, 2006			Fair Value
	Amortized Cost	Unrealized Gains	Losses	Amortized Cost	Unrealized Gains	Losses	
Corporate debt securities	\$ 7,840	\$ 19		\$ 7,859	\$ 6		\$ 12,741

	3,088	2,918
Less accumulated depreciation and amortization	(2,571)	(2,308)
	\$ 517	\$ 610

Depreciation and amortization expense from operations related to property and equipment for the years ended December 31, 2007, 2006 and 2005 was \$272,000, \$295,000 and \$489,000, respectively.

Restructuring Accrual

The Company recorded restructuring charges of approximately \$252,000 in connection with the closing of CryoCor GmbH during 2006 and \$30,000 remains accrued on the balance sheet at December 31, 2007, primarily due to payments owed on the remaining term of the facility lease, which will run through June 2008. The Company has not incurred any additional restructuring costs in connection with the closing of CryoCor GmbH subsequent to June 30, 2006.

In January 2006, the Company received a non-approvable letter from the United States Food and Drug Administration (FDA) related to its application for premarket approval (PMA) for the treatment of right atrial flutter, a cardiac arrhythmia. As a result of that letter, the Company restructured its operations in early March 2006 whereby it reduced its staffing levels to reduce its monthly cash requirements. During 2006, the Company recorded severance expenses of \$280,000 and sales and marketing contract termination expenses of \$50,000 associated with the restructuring, all of which was paid during 2006. The Company's San Diego facilities were not impacted by the restructuring plan and all restructuring activities were substantially completed as of July 2006. In 2006, the Company amended its PMA, and in August 2007, the Company was notified by the FDA that its PMA for right atrial flutter had been approved.

Note 4. Commitments and Contingencies***Leases***

The Company leases its facilities under a non-cancelable operating lease, which expires during 2008. The lease requires the Company to pay for all maintenance, insurance and property taxes. Under the terms of the Company's facility lease, the Company was required to execute a letter of credit in favor of the landlord for \$100,000. The restricted cash of \$100,000 that collateralizes the letter of credit is included in Other Assets on the balance sheet.

The Company historically leased certain equipment under capital lease obligations. In July 2001, the Company executed a lease line of \$850,000 with a financial institution and in May 2002, extended the lease line to a total of \$1.5 million. The lease line was intended to fund equipment acquisitions and leasehold improvements. The capital leases were all paid off as of December 31, 2006.

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

Annual future minimum obligations for operating leases as of December 31, 2007 are as follows (in thousands):

2008	290
2009	3
Total minimum lease payments	\$ 293

Rent expense was \$410,000, \$422,000 and \$398,000 for the years ended December 31, 2007, 2006 and 2005, respectively.

Long-Term and Short-Term Debt

In July 2003, the Company executed a term loan agreement for \$3.0 million with a financial institution. Under this agreement, the Company made interest-only payments for the first six months following its execution and would make principal payments to fully amortize the advance over the subsequent 36-month term.

In March 2005, the Company entered into an agreement whereby it borrowed \$7.0 million from a financial institution (the facility). As part of this transaction, the Company paid off its existing term loan which had an outstanding balance of \$1.8 million at the time of the pay off. The facility bore interest at a rate of 11.25% per annum and required monthly interest-only payments through June 2007, at which time all remaining principal was due and payable. In conjunction with the facility, the Company issued two warrants to purchase a total of 68,288 shares of common stock. The fair value of the warrants was \$657,000 based upon an estimated fair value upon the date of grant of \$13.43 per common share, an estimated life of six years, a volatility rate of 70% and a risk free interest rate of 4.34%. The fair value of the warrant was recorded as a discount to the facility and was amortized to interest expense on a straight-line basis over the term of the loan. The warrants are exercisable through 2015.

In June 2007, the Company entered into a loan and security agreement (the Loan Agreement) with Oxford Finance Corporation, ATEL Ventures, Inc. and Silicon Valley Bank (together, the Lenders) that provides the Company with a \$14.0 million credit facility (the credit facility), as evidenced by secured promissory notes. The Company paid off its previous outstanding debt facility in full prior to entering into the Loan Agreement. The credit facility is available in two draws, with the first draw of \$6.0 million received in June 2007, and the second draw of \$8.0 million available for borrowing after the occurrence of both of the following conditions: (i) approval is received from the FDA of the Company's application for pre-market approval for the treatment of right atrial flutter with the CryoCor Cardiac Cryoablation System (which occurred in August 2007), and (ii) the Company receives unrestricted net cash proceeds of at least \$20.0 million from the closing of an equity financing. Upon the applicable drawdown, the Company will make interest-only payments for the first six months following each advance, and will then make principal payments to fully amortize the advance over the subsequent 30-month term (the Term Loan). The Term Loan bears interest at a rate of 11.77% per annum. The Loan Agreement provides that the credit facility is secured by the Company's assets, excluding intellectual property.

In connection with entering into the Loan Agreement, the Company issued warrants to the Lenders to purchase 93,697 shares of common stock at a price of \$5.23 per share. The fair value of the warrants was \$388,000 based on the stock price on the date of grant of \$4.81 per common share, an expected life of ten years, an estimated volatility rate of 86%, and an estimated risk-free interest rate of 5.12%. The fair value of the warrants was recorded as a discount to the credit facility and is being amortized to interest expense on a straight-line basis over the 36-month term of the loan. The remaining unamortized fair value of the warrants is \$323,000 at December 31, 2007. The warrants are exercisable through June 2017.

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

Pursuant to the terms of the Loan Agreement, the Company is subject to a material adverse change clause, which permits the holder of the note to call the balance if a material adverse change occurs. A material adverse change is defined as, (i) a material impairment in the perfection or priority of Lenders' lien in the collateral or in the value of such collateral; (ii) a material adverse change in the business, operations, or condition (financial or otherwise) of the Company; or (iii) a material impairment of the prospect of repayment of any portion of the obligations. Due to the Company's current financial condition, it has classified the entire principal balance as current although the contractual payment structure requires the Company to make monthly payments through July 2010.

In accordance with the Loan Agreement, the Company is subject to certain non-financial covenants. The Company was in compliance with all covenants at December 31, 2007.

Long-term and short-term debt consisted of the following at December 31 (in thousands):

	2007	2006
Short-term debt	\$ 6,000	\$ 7,000
Less: debt discount	(323)	(143)
	\$ 5,677	\$ 6,857

License Agreement

In August 2000, the Company executed an exclusive, irrevocable, perpetual, worldwide, non-transferable, royalty-free, fully-paid up license agreement with CryoGen, Inc. (CryoGen) for the exclusive use of their intellectual property in the field of cardiac arrhythmias. The Company has the right to sublicense, make, have made, import, use, have used, offer to sell, sell or have sold licensed products and perform and have performed processes under certain CryoGen intellectual property rights, enhancements and joint enhancement interest, solely in the CryoCor field. The license expires concurrent with the last patent to expire.

Note 5. Stockholders' Equity**Initial Public Offering**

In July 2005, 3,709,090 shares of common stock were sold at \$11.00 per share during the Company's initial public offering.

Preferred Stock

In conjunction with the initial public offering, all outstanding shares of preferred stock were converted to common stock. Prior to the conversion of the preferred stock to common stock, the Company recorded accretion to the redemption value of the preferred stock and cumulative dividends on certain series of preferred stock. In 2005, the Company recorded \$2.8 million for dividends and accretion.

Common Stock

In April 2007, the Company completed a private placement of its common stock, raising a total of \$5.5 million. The Company issued 1,052,423 shares of common stock under the private placement, at a price of \$5.14 per share, representing the closing bid price on the Nasdaq Stock Market on the date the securities purchase agreement was signed.

Table of Contents

CryoCor, Inc.

Notes to Consolidated Financial Statements (Continued)

In June 2007, the Company entered into a series of agreements with Boston Scientific Corporation (BSC) and Boston Scientific Scimed, Inc (BSS), including a common stock purchase agreement with BSS pursuant to which it sold to BSS 368,188 shares of its common stock for a total of \$2.5 million. The purchase price of each share of common stock sold was \$6.79. Pursuant to the common stock purchase agreement, a second purchase of shares of the Company s common stock for an aggregate purchase price of \$2.5 million will take place within ten business days after the date, if any, that certain milestones specified in a related development and license agreement are achieved. The purchase price of each share of common stock to be sold in the second closing will be determined at the time of such closing based on the greater of (a) \$2.53 and (b) the product of (i) the average closing sales price of the Company s common stock on the Nasdaq Stock Market for the 60 consecutive trading days prior to the second closing and (ii) 1.25.

Warrants

In March 2005, the Company issued a warrant to purchase 68,288 shares of common stock in connection with a debt facility (see Note 4).

During April 2007, in connection with the Company s private placement of common stock, investors purchased warrants that are exercisable, in total, for 578,824 shares of common stock at an exercise price of \$5.14 per share. The warrants were purchased by the investors at a price of \$0.07 per warrant share and were recorded as equity in accordance with the FASB s Emerging Issues Task Force Issue No. 00-19, *Accounting for Derivative Financial Instruments Indexed to, and Potentially Settled in, a Company s Own Stock*. The warrants became exercisable six months after the issuance, and the warrants expire in April 2012.

In June 2007, the Company issued warrants to purchase 93,697 shares of common stock in connection with a loan and security agreement (see Note 4).

As of December 31, 2007, the Company had outstanding warrants to purchase 756,319 shares of common stock.

Note 6. Collaboration Agreement

In June 2007, the Company entered into a development and license agreement with BSC pursuant to which the Company may develop certain products and license to BSC intellectual property to permit BSC to commercialize certain products. The agreement provides for payments by BSC to the Company as consideration for the Company s performance of its development obligations and also provides for possible royalty payments by each party to the other party if certain elections are made. The Company will conduct development activities under the agreement pursuant to a development plan that sets forth a description of items to be provided, including specifications and requirements. In conjunction with signing the agreement, the Company received an advance payment of \$500,000 against the development milestones which was recorded as deferred revenue when initially received. We may receive additional payments based upon the successful completion of the development milestones, and will receive royalty payments if either the balloon product or the console being developed under the development and license agreement are sold.

Per our revenue recognition policy, revenue from a milestone achievement is recognized when earned based on several criteria. If not earned, the milestone achievement is recognized over the remaining minimum period of our performance obligations under the agreement. Therefore, advance payments the Company receives in excess of amounts earned are classified as deferred revenues until earned. At December 31, 2007, \$167,000 of the advance payment received from BSC remains deferred and will be recognized through March 31, 2008.

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)****Note 7. Employee and Non-employee Stock Benefit Plans*****Equity Compensation Plans***

The Company currently has three active share-based compensation plans (collectively the Plans): the 2000 Stock Option Plan, the 2005 Equity Incentive Plan and the Non-Employee Director Plan. As of December 31, 2007, 1,662,522 shares of the Company's common stock were reserved for issuance upon exercise of options granted by the Company and 97,107 shares were available for future grant for issuance under the Plans. The Plans provide for the grant of incentive and non-statutory stock options and restricted stock awards to employees, non-employee directors and outside consultants.

The exercise price of incentive stock options must equal at least the fair market value on the date of grant and the exercise price of non-statutory stock options may be not less than 85% of the fair market value on the date of grant. Stock options granted under the Plans expire no later than ten years from the date of grant. Stock options generally vest over a period of four years. Unvested common shares obtained through early exercise of stock options are subject to repurchase by the Company at the original issue price. Since its initial public offering, the Company no longer permits the early exercise of stock options. During the years ended December 31, 2007, 2006 and 2005, 565 shares, 5,065 shares and 2,966 shares have been repurchased by the Company, respectively. At December 31, 2007, 2006 and 2005, 400, 3,668 and 64,801 shares were subject to repurchase, respectively.

Information under FAS123(R) for the Year Ended December 31, 2007 and 2006

A summary of stock options under the Plans as of December 31, 2007 and activity during the two years then ended are as follows:

	Shares	Weighted- average exercise price	Weighted- average remaining contractual term (in years)	Aggregate intrinsic value (in thousands)
Options outstanding at December 31, 2005	1,085,914	\$ 1.32		
Options granted	866,176	\$ 2.73		
Options exercised	(381,820)	\$ 0.63		
Options forfeited	(241,545)	\$ 1.87		
Options outstanding at December 31, 2006	1,328,725	\$ 2.33		
Options granted	527,305	\$ 3.12		
Options exercised	(103,263)	\$ 0.91		
Options forfeited	(90,245)	\$ 3.84		
Options outstanding at December 31, 2007	1,662,522	\$ 2.59	8.11	\$ 1,338
Options vested and expected to vest at December 31, 2007	1,573,823	\$ 2.58	8.09	\$ 1,282
Options vested and exercisable at December 31, 2007	705,707	\$ 2.38	7.57	\$ 745

The weighted-average grant-date fair value of stock options granted during the year ended December 31, 2007 and 2006 was \$2.39 and \$1.89, respectively. Aggregate intrinsic value is the sum of the amounts by which the quoted market price of the Company's stock exceeded the exercise

Edgar Filing: CRYOCOR INC - Form 10-K

price of the options at December 31, 2007 (in-the-money options). The total intrinsic value of options exercised during the year ended December 31, 2007 was \$323,000.

F-20

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

As of December 31, 2007, \$3.7 million of total unrecognized compensation cost related to unvested share-based compensation arrangements granted under the Plans is expected to be recognized over a weighted-average period of 1.6 years.

Cash proceeds from the exercise of stock options were \$94,000, \$240,000 and \$147,000 for the years ended December 31, 2007, 2006 and 2005, respectively. Because of the Company's net operating losses, the Company did not realize any tax benefits for the tax deductions from share-based payment arrangements during the years ended December 31, 2007, 2006 and 2005.

Information under FAS123 for the Year Ended December 31, 2005

A summary of activity under the Plans is as follows:

	Shares available	Number of shares	Options Outstanding and Exercisable Weighted- average exercise price
Balance at December 31, 2004	82,701	1,158,875	\$ 0.94
Authorized	528,224		
Granted	(337,791)	337,791	\$ 1.83
Exercised		(236,331)	\$ 0.62
Repurchased	2,966		\$ 0.62
Canceled	174,421	(174,421)	\$ 0.74
Balance at December 31, 2005	450,521	1,085,914	\$ 1.32

The weighted-average fair value of options granted during 2005 was \$11.87. At December 31, 2005, the weighted-average remaining contractual life of outstanding options was 8.59 years.

Stock Options Granted to Non-employees

The Company accounts for equity instruments issued to non-employees in accordance with the provisions of SFAS 123 and Emerging Issues Task Force Issue (EITF) No. 96-18, *Accounting for Equity Instruments that Are Issued to other than Employees for Acquiring, or in conjunction with Selling Goods, or Services* (EITF 96-18) which require that such equity instruments are recorded at their fair value on the measurement date. The measurement of share-based compensation is subject to periodic adjustment as the underlying equity instruments vest. Non-employee stock-based compensation charges are amortized over the vesting period on a straight-line basis. The following table illustrates the weighted-average assumptions for the Black-Scholes valuation model used in determining the fair value of options granted to non-employees:

	Years Ended December 31,		
	2007	2006	2005
Expected volatility	95%	81%	70%
Expected term	9.51 years	10 years	10 years
Risk-free interest rate	4.59%	4.51%	4.34%
Expected dividends	0%	0%	0%

During the years ended December 31, 2007 and 2005 the Company granted options to purchase 45,000 and 4,838 shares, respectively, of common stock to consultants at a weighted-average exercise price of \$2.76 and \$0.62 per share, respectively. No options were granted to non-employees during 2006; however, three employees converted to consultants during the year. As part of their consultancy contracts, some of

their option grants

F-21

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

continued to vest and were therefore treated under EITF 96-18 subsequent to employment termination. All options generally vest over a four-year period and have a ten year life. The related stock-based compensation expense related to non-employees was \$171,000, \$56,000, and \$130,000 for the years ended December 31, 2007, 2006 and 2005, respectively.

Employee Stock Purchase Plan

The Company has an Employee Stock Purchase Plan (ESPP) for all eligible employees to purchase its common stock through payroll deductions at 85% of the lower of the stock's fair market value on the first day of the offering or the last day of the purchase period. Purchases are limited to 15% of each employee's compensation. In addition, the Board of Directors has specified that the maximum number of shares of common stock that may be purchased by any participant on any purchase date during any offering commencing prior to September 17, 2007 was 483 shares; any offering commencing on or after September 17, 2007 has a 1,500 share maximum on any purchase date. As of December 31, 2007, the Company had issued 21,853 shares over the life of the ESPP at an average price of \$2.31. At December 31, 2007, 139,437 shares were reserved for future issuance under the ESPP.

The fair value of each option element of the ESPP is estimated on the date of grant using the Black-Scholes valuation model that uses the assumptions noted in the following table. Expected volatilities are based on historical volatility of the Company's stock as well as the stock of comparable medical device companies. Expected term represents the four six-month purchase periods within a 24-month offering period for the ESPP. The risk-free interest rate for periods within the expected term of the award is based on the U.S. Treasury yield curve in effect at the time of grant.

	Year ended December 31, 2007		Year ended December 31, 2006		Year ended December 31, 2005
Expected volatility	86%	103%	78%		70%
Expected term	0.5	2 years	0.5	2 years	1.41 years
Risk-free interest rate	4.1%	5.1%	2.0%	5.1%	2.5%
Expected dividends		0%		0%	0%

Cash received from ESPP contributions for the year ended December 31, 2007, 2006 and 2005 was \$30,000, \$18,000 and \$9,000, respectively. Because of the Company's net operating losses, the Company did not realize any tax benefits for the tax deductions from share-based payment arrangements during the years ended December 31, 2007, 2006 and 2005.

Note 8. Income Taxes

On July 13, 2006, the FASB issued Interpretation No. 48, *Accounting for Uncertainty in Income Taxes - An Interpretation of FASB Statement No. 109* (FIN 48), which clarifies the accounting for uncertainty in income taxes recognized in an entity's financial statements in accordance with SFAS No. 109. Under FIN 48, the impact of an uncertain income tax position on the income tax return must be recognized at the largest amount that is more-likely than-not to be sustained upon audit by the relevant taxing authority. An uncertain income tax position will not be recognized if it has 50% or less likelihood of being sustained upon examination. Additionally, FIN 48 provides guidance on derecognition, classification, interest and penalties, accounting in interim periods, disclosure and transition. For public companies, FIN 48 became effective for fiscal years beginning after December 15, 2006.

The Company adopted the provisions of FIN 48 on January 1, 2007. There were no unrecognized tax benefits as of the date of adoption. As a result of the implementation of FIN 48, the Company did not recognize

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

an increase in the liability for unrecognized tax benefits. There are no unrecognized tax benefits included in the balance sheet that would, if recognized, affect the effective tax rate.

The Company's practice is to recognize interest and/or penalties related to income tax matters in income tax expense. The Company had no accrual for interest or penalties on the Company's balance sheets at December 31, 2006 and at December 31, 2007, and has not recognized interest and/or penalties in the statement of operations for the year ended December 31, 2007.

The Company is subject to taxation in the United States and various state jurisdictions. The Company's tax years for 2000 and forward are subject to examination by the United States and state tax authorities due to the carry forward of unutilized net operating losses and research and development credits carried forward.

The adoption of FIN 48 did not impact the Company's financial condition, results of operations, or cash flows. At December 31, 2007, the Company had net deferred tax assets of \$10.1 million. Due to uncertainties surrounding the Company's ability to generate future taxable income to realize these assets, a full valuation has been established to offset the net deferred tax asset. Additionally, the future utilization of the company's net operating loss and research and development credit carry forwards to offset future taxable income may be subject to an annual limitation, pursuant to Internal Revenue Code Sections 382 and 383, as a result of ownership changes that may have occurred previously or that could occur in the future. The Company has not performed a Section 382 analysis to determine the limitation of the net operating loss and research and development credit carry forwards. Until this analysis has been performed the Company has removed the deferred tax assets for net operating losses of \$22.5 million and research and development credits of \$3.1 million generated through 2007 from its deferred tax asset schedule and has recorded a corresponding decrease to its valuation allowance. When this analysis is finalized, the Company plans to update its unrecognized tax benefits under FIN 48. Due to the existence of the valuation allowance, future changes in the Company's unrecognized tax benefits will not impact the Company's effective tax rate.

At December 31, 2007, the Company had Federal and California income tax net operating loss carry forwards of approximately \$58.1 million and \$38.1 million, respectively. The Federal and California tax loss carry forwards will begin to expire in 2020 and 2012, respectively, unless previously utilized. In addition, the Company has Federal and California research and development tax credit carry forwards of \$2.0 million and \$1.7 million, respectively. The Federal research and development credit carry forwards will begin to expire in 2020 unless previously utilized. The California research and development credit carry forwards carry forward indefinitely.

Significant components of the Company's deferred tax assets as of December 31, 2007 and 2006 are listed below. A valuation allowance of \$10.1 million and \$29.2 million at December 31, 2007 and 2006, respectively, has been recognized to offset the net deferred tax assets as realization of such assets is uncertain. Amounts are shown in thousands as of December 31, of the respective years:

	December 31,	
	2007	2006
Deferred tax assets:		
Net operating loss carryforwards	\$	\$ 17,798
Research and development credits		2,673
Capitalized research and development	9,358	8,072
Other, net	723	612
Total deferred tax assets	10,081	29,155
Valuation allowance	(10,081)	(29,155)
Net deferred tax assets	\$	\$

Table of Contents**CryoCor, Inc.****Notes to Consolidated Financial Statements (Continued)**

The change in the valuation allowance is primarily attributable to the removal of the deferred tax assets related to the net operating losses and research and development credits carried forward offset by the change in the current year deferred tax assets.

A portion of the net operating loss carry forwards as of December 31, 2007 include amounts related to stock option deductions. Under FAS 123R, any excess tax benefits from share-based compensation are only realized when income taxes payable is reduced, with the corresponding credit posted to Additional Paid in Capital.

Note 9. 401(k) Defined Contribution Plan

During 2000, the Company adopted a 401(k) defined contribution plan (the 401(k) Plan) that covers substantially all full time employees, as defined, who meet certain age requirements. Employees may contribute up to a maximum of 25% of their annual compensation (subject to a maximum limit imposed by federal tax law). The Company may make qualified non-elective contributions to the Plan. The amount of such contribution for each plan year shall be an amount determined by the Company. The allocation of qualified non-elective contributions shall be made to the accounts of non-highly compensated participants only. Employer contributions begin vesting upon completion of two years of service and become fully vested upon six years of service. As of December 31, 2007, the Company had made no contributions to the 401(k) Plan.

Note 10. Quarterly Financial Information (unaudited)

Summarized quarterly results of operations for the years ended December 31, 2007 and 2006 are as follows (in thousands, except per share amounts):

	Year ended December 31, 2007			
	First	Second	Third	Fourth
Product revenue	\$ 66	\$ 72	\$ 46	\$ 74
Collaboration revenue			167	166
Cost of sales	628	651	683	748
Research and development expenses	1,588	1,920	2,191	1,740
Net loss attributable to common stockholders	(3,432)	(3,939)	(4,034)	(4,351)
Basic and diluted net loss per common share	(0.31)	(0.33)	(0.32)	(0.35)
	Year ended December 31, 2006			
	First	Second	Third	Fourth
Product sales	\$ 113	\$ 159	\$ 214	\$ 54
Cost of sales	763	547	542	616
Research and development expenses	1,531	1,395	1,369	1,540
Net loss attributable to common stockholders	(4,271)	(3,570)	(3,363)	(3,848)
Basic and diluted net loss per common share	(0.40)	(0.33)	(0.31)	(0.36)
