SECURITIES AND EXCHANGE COMMISSION
Washington, D.C. 20549

FORM 10-K

(Mark One)

ANNUAL REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the fiscal year ended December 31, 2014

TRANSITION REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

Commission File Number 333-146542

AMPIO PHARMACEUTICALS, INC.

(Exact Name of Registrant as Specified in Its Charter)

Delaware
(State or other jurisdiction of
incorporation or organization)

26-0179592
(I.R.S. Employer
Identification Number)

373 Inverness Parkway

Suite 200

Englewood, Colorado
(Address of principal executive offices)

80112
(Zip Code)

(720) 437-6500

(Registrant's telephone number, including area code)

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Name of each exchange on which registered
Common Stock, par value \$.0001 per share	The NYSE Market

Securities registered pursuant to Section 12(g) of the Act: None

Indicate by check mark if the Registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes No

Indicate by check mark if the Registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Exchange Act. Yes No

Indicate by a check mark whether the Registrant: (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the Registrant was required to file such reports) and (2) has been subject to such filing requirements for the past 90 days. Yes No

Indicate by check mark whether the registrant has submitted electronically and posted on its corporate Web site, if any, every Interactive Data File required to be submitted and posted pursuant to Rule 405 of Regulation S-T during the preceding 12 months (or for such shorter period that the registrant was required to submit and post such files). Yes No

Indicate by check mark if disclosure of delinquent filers pursuant to Item 405 of Regulation S-K is not contained herein, and will not be contained, to the best of the Registrant's knowledge, in definitive proxy or information statements incorporated by reference in Part III of this Form 10-K or any amendment to this Form 10-K

Indicate by check mark whether the Registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, or a smaller reporting company. See definition of "large accelerated filer", "accelerated filer" and "smaller reporting company" in Rule 12b-2 of the Exchange Act. (check one):

Large Accelerated Filer Accelerated Filer
Non-Accelerated Filer (Do not check if a smaller reporting company) Smaller reporting company
Indicate by check mark whether the Registrant is a shell company (as defined in Rule 12b-2 of the Exchange Act). Yes No

The aggregate market value of common stock held by non-affiliates of the Registrant as of June 30, 2014 was \$413,000,000 based on the closing price of \$8.35 as of that date.

Indicate the number of shares outstanding of each of the Registrant's classes of common stock, as of the latest practicable date: As of February 1, 2015, 51,972,266 shares of common stock were outstanding.

SPECIAL NOTE REGARDING FORWARD-LOOKING STATEMENTS AND INDUSTRY DATA

Forward Looking Statements

This Annual Report on Form 10-K, or Annual Report, includes forward-looking statements within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, or the Exchange Act. All statements other than statements of historical facts contained in this Annual Report, including statements regarding our anticipated future clinical and regulatory events, future financial position, business strategy and plans and objectives of management for future operations, are forward-looking statements. Forward looking statements are generally written in the future tense and/or are preceded by words such as may, will, should, forecast, could, expect, suggest, believe, estimate, continue, anticipate, intend, plan, or similar words, or the terms or other variations on such terms or comparable terminology. Such forward-looking statements include, without limitation, statements regarding the anticipated start dates, durations and completion dates, as well as the potential future results, of our ongoing and future clinical trials, the anticipated designs of our future clinical trials, anticipated future regulatory submissions and events, the potential future commercialization of our product candidates, our anticipated future cash position and future events under our current and potential future collaborations. These forward-looking statements are subject to a number of risks, uncertainties and assumptions, including without limitation the risks described in Risk Factors in Part I, Item 1A of this Annual Report. These risks are not exhaustive. Other sections of this Annual Report include additional factors that could adversely impact our business and financial performance. Moreover, we operate in a very competitive and rapidly changing environment. New risk factors emerge from time to time and it is not possible for our management to predict all risk factors, nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in any forward-looking statements. You should not rely upon forward-looking statements as predictions of future events. We cannot assure you that the events and circumstances reflected in the forward-looking statements will be achieved or occur and actual results could differ materially from those projected in the forward-looking statements. We assume no obligation to update or supplement forward-looking statements.

We obtained statistical data, market and product data, and forecasts used throughout this Form 10-K from market research, publicly available information and industry publications. While we believe that the statistical data, industry data and forecasts and market research are reliable, we have not independently verified the data, and we do not make any representation as to the accuracy of the information.

Table of Contents

AMPIO PHARMACEUTICALS, INC.

PART I

Item 1. Business

Ampio Pharmaceuticals, Inc. is a biopharmaceutical company focused primarily on the development of therapies to treat prevalent inflammatory conditions for which there are limited treatment options. Ampio's two lead product candidates in development are Ampion for osteoarthritis of the knee and Optina for diabetic macular edema.

Our product portfolio is primarily based on the work of Dr. David Bar-Or, the Director of Trauma Research LLC for both the Swedish Medical Center located in Englewood, CO and St. Anthony Hospital located in Lakewood, CO. For over two decades, while directing these two trauma research laboratories, Dr. Bar-Or and his staff have built a robust portfolio of product candidates focusing on inflammatory conditions. Ampio's initial clinical programs were selected from Dr. Bar-Or's research based on certain criteria, particularly the ability to advance the candidates rapidly into late-stage clinical trials. The benchmarks used to build our pipeline were products with: (i) potential indications to address large underserved markets; (ii) strong intellectual property protection and the potential for market and data exclusivity; and (iii) a well-defined regulatory path to marketing approval.

We are primarily developing compounds that decrease inflammation by (i) inhibiting specific pro-inflammatory compounds by affecting specific pathways at the protein expression and at the transcription level; (ii) activating specific phosphatase or depleting available phosphate needed for the inflammation process; and (iii) decreasing vascular permeability.

We are also a majority stockholder in Luoxis, an in-vitro diagnostics company, and the sole stockholder of Vyrrix Pharmaceuticals, a specialty pharmaceutical company. Luoxis' novel diagnostic platform measures human Oxidation-Reduction Potential (ORP). Vyrrix's therapeutic concentration is in men's health. We formed the subsidiaries to advance these proprietary technologies forward and provide a separate financing platform to fund development and commercialization of these products.

Corporate History

Our predecessor, DMI Life Sciences, Inc. (Life Sciences), was formed by Michael Macaluso, our chief executive officer and chairman of our Board of Directors, and incorporated in Delaware in December 2008. Life Sciences did not conduct any business activity until April 2009, at which time Life Sciences purchased certain assigned intellectual property (including 107 patents and pending patent applications, business products and tangible property) from DMI BioSciences, Inc. (BioSciences), a scientific discovery, privately-held Colorado corporation formed in May 1990 by Dr. David Bar-Or. Life Sciences issued 3,500,000 shares of our common stock to BioSciences, and assumed certain liabilities, as consideration for the assets purchased from BioSciences. In March 2010, Life Sciences merged with a subsidiary of Chay Enterprises, Inc. (Chay), a publicly-traded company incorporated in Colorado. Simultaneous with the merger, we changed our name to Ampio Pharmaceuticals, Inc. (Ampio), and reincorporated in Delaware. As a result of the Chay merger, we became a publicly-traded company and the outstanding Series A preferred stock of Life Sciences was converted into Life Sciences common stock, in accordance with Life Sciences amended and restated certificate of incorporation. For accounting and financial reporting purposes, Life Sciences was considered the acquirer and the Chay merger was treated as a reverse merger. All financial information presented in this Form 10-K for periods prior to the Chay merger reflects only that of Life Sciences, and does not reflect the pre-merger Chay assets, liabilities, or operating results. In addition, all share, per share and related Life Sciences information has been

adjusted to take into account the Chay merger.

In 2011, we acquired all of the outstanding stock of DMI BioSciences, Inc. (BioSciences) for 8,667,905 shares of our common stock (the merger stock). We acquired BioSciences in order to obtain all rights to Zertane, BioScience s male sexual dysfunction drug for premature ejaculation (PE). As called for in the merger agreement, Ampio issued 405,066 shares of merger stock to holders of BioSciences in-the-money stock options and warrants, 500,000 shares of merger stock to holders of two BioSciences promissory notes in extinguishment of the notes, and placed 250,000 shares of merger stock in an indemnification escrow until December 31, 2011. The remaining 7,512,839 shares of merger stock were issued to the holders of BioSciences common stock on a pro rata basis. As required by the merger agreement, at the closing BioSciences donated back to Ampio s capital 3,500,000 shares of Ampio common stock formerly owned by BioSciences. Ampio separately issued 212,693 options in replacement of 250,850 BioSciences options that were out-of-the-money as of the date of execution of the merger agreement. In June 2011, an additional 223,024 options were issued in exchange for 98,416 previously issued shares of Ampio stock pursuant to an agreement with three former BioSciences option holders. During 2011, we filed a claim on the indemnification escrow and were awarded 95,700 shares of Ampio stock to reflect the full value of the 223,024 options issued in exchange for the shares relinquished. On December 31, 2011, the remaining 154,300 indemnification escrow shares were allocated to the appropriate shareholders. All shares donated back, relinquished and escrow shares awarded to Ampio have been cancelled.

Table of Contents**Our Product Pipeline****AMPION*****Ampion for Osteoarthritis and Other Inflammatory Conditions***

Ampion is a sub 5000 molecular weight fraction of commercial human serum albumin (HSA). The primary constituent ingredient is aspartyl-alanyl diketopiperazine (DA-DKP) an endogenous immunomodulatory molecule derived from the N-terminus of HSA. Based on Ampion's published in-vitro findings, DA-DKP appears to play a significant role in the homeostasis of inflammation. DA-DKP is believed to reduce inflammation by suppressing pro-inflammatory cytokine production in T-cells. Ampion also contains other known small molecules that confer anti-inflammatory effects to complement the activity of DA-DKP and derive in-vitro and in-vivo effects. We believe the non-steroidal, low molecular weight, anti-inflammatory biologic has the potential to be used in a wide variety of acute and chronic inflammatory conditions as well as immune-mediated diseases. Ampion is currently developing Ampion as an intra-articular injection to treat osteoarthritis of the knee.

Ampion is manufactured as the low molecular weight filtration product of commercial human serum albumin containing DA-DKP, N-acetyltryptophan, caprylate, and other small molecules either contained in HSA or added to HSA during the processing and production of commercial HSA products. DA-DKP, the primary constituent ingredient contained in Ampion, is a locally generated molecule formed as a physiological result of the cleavage and cyclization of the N-terminal aspartic acid and alanine residues of human albumin. The molecule was originally discovered in the blood and cerebrospinal fluid of patients several days after suffering severe closed head injuries. A high concentration of DA-DKP has also been detected in biofilms found on endotracheal tubes recovered from intubated patients and on implanted orthopedic plates and screws. Together these findings suggest a mechanism by which DA-DKP contributes to the ability to reduce the body's inflammatory response following insult or injury.

DA-DKP is believed to reduce inflammation through the activation of Ras-related protein 1 (Rap1). Rap1 interrupts the kinase cascade by regulating the amount of rapidly accelerated fibrosarcoma (Raf) kinases available for interaction with Ras, inhibiting antigen-specific Ras activation. This decrease disrupts the mitogen-activation protein kinase (MAPK) cascade and results in decreased immunoinflammatory cytokine gene transcription. The clinical results which are detailed below also suggest an effect other than anti-inflammatory properties are at work and imply more prolonged healing-like effects.

Market Opportunity

Osteoarthritis is the most common form of arthritis, affecting over 100 million people in the United States. It is a progressive disorder of the joints involving degradation of the intra-articular cartilage, joint lining, ligaments, and bone. The incidence of developing osteoarthritis of the knee or hip over a lifetime is approximately 45% and 25%, respectively. Certain risk factors in conjunction with natural wear and tear lead to the breakdown of cartilage. Osteoarthritis is caused by inflammation of the soft tissue and bony structures of the joint, which worsens over time and leads to progressive thinning of articular cartilage. Other progressive effects include narrowing of the joint space, synovial membrane thickening, osteophyte formation and increased density of subchondral bone. The global osteoarthritis therapeutics market continues to expand and is expected to exceed \$7 billion by 2015 and the global demand for osteoarthritis of the knee treatment is expected to be fueled by favorable demographics and increasing awareness of treatment options. Despite the size and growth of the osteoarthritis of the knee market, few adequate treatment options currently exist. We believe that if Ampion proves to be effective in the most severe patients, the market could grow substantially.

Competition

The currently available treatments for osteoarthritis of the knee include oral non-steroidal anti-inflammatory agents, opioids, pain patches, intra-articular (IA) corticosteroids, and IA hyaluronic acid (HA) injections. Despite wide availability and years of clinical use, none of these agents are adequately meeting the needs of the market as evidenced by the most recently published knee osteoarthritis clinical practice guidelines. In May 2013, the American Academy of Orthopedic Surgeons (AAOS) issued their second edition of clinical practice guidelines for the treatment of osteoarthritis of the knee. The AAOS was unable to recommend for or against the use of intra-articular corticosteroid injections as studies designed to indicate efficacy are inconclusive. Further, the AAOS was also unable to recommend for or against the use of acetaminophen, opioids, or pain patches as the efficacy studies in this area are also inconclusive. Most importantly, the AAOS does not recommend (with a strong strength of recommendation) the use of hyaluronic acid injections as, in the Association s assessment, the clinical evidence does not support their use. This latest clinical practice guideline underscores a pervasive unmet need in the treatment of osteoarthritis of the knee given few accepted and available treatments. We believe Ampion is a novel treatment option that, if approved, would be the first non-steroidal, non-hyaluronic-based intra-articular treatment available for the treatment of osteoarthritis of the knee.

Table of Contents***Phase I Clinical Trial Results***

In October 2011, we announced results from the first part of our Ampion[®] -in-Knee (AIK) study of Ampion[®] in the treatment of osteoarthritis of the knee. We conducted our Phase I trial in Australia because the biologics legislation governing the Australian Therapeutic Goods Administration (TGA) allowed us to move Ampion[®] directly into human clinical trials as the TGA recognized that HSA has an already established safety profile in humans by virtue of its longstanding commercial use. The AIK trial was conducted in patients diagnosed with moderately-severe to severe osteoarthritis of the knee. Sixty patients were enrolled in a 3 arm randomized double-blind trial designed to establish tolerability and efficacy of Ampion[®]. In the three arms of the trial, patients were injected in the knee with either: (i) steroid, lidocaine, and saline; (ii) steroid, lidocaine, and Ampion[®], or; (iii) steroid, saline, and Ampion[®]. There were very few moderate to severe adverse events with those subjects receiving the standard of care (Lidocaine/Steroids, 3 patients or 15%) and even fewer in either arm receiving Ampion[®] in addition to steroids (2 patients or 10%). Overall, there were 4 treatment-related adverse events reported, but no moderate to severe treatment-related adverse events were reported. Upon establishing Ampion[®] was safe for human use, these favorable results allowed us to proceed to the second part of the Phase I trial evaluating Ampion[®] as a monotherapy against saline.

In April 2012, we announced results from the second part of our AIK study of Ampion[®] for the treatment of osteoarthritis of the knee. The second part of the AIK study was a 30 patient randomized (1:1), double-blind, vehicle controlled trial designed to evaluate the safety and efficacy of Ampion[®] 4mL in osteoarthritis of the knee patients. The 30 patients represented the efficacy evaluable population who did not receive a betamethasone injection as rescue medication of the intent-to-treat population of 43 patients. The primary endpoint was mean change in pain from baseline for Ampion[®] compared to saline at 84 days following a single intra-articular injection into the knee measured on the pain scale known as the Numerical Rating Scale (NRS). Secondary endpoints included evaluating the safety as well as responder rate, defined as a 2 point reduction in pain on the NRS. A brief summary of the combined Ampion[®] topline results is as follows:

Patients receiving Ampion[®] achieved a significantly greater reduction in pain from baseline at 12 weeks compared to saline vehicle control (1.76; p=0.04).

Patients receiving Ampion[®] achieved a statistically significant -2.22 reduction in pain from baseline (p<0.05) to 12 weeks compared to saline vehicle control (-0.46; p=0.34).

Clinical Development Pathway

Upon conclusion of the AIK trial which yielded the positive results summarized above, we presented a package containing both pre-clinical and clinical data to the blood products division of the Center for Biologics Evaluation and Research (CBER) of the FDA. The original guidance toward an Ampion[®] Biologics License Application (BLA) filing included instruction to conduct customary toxicology work inclusive of animal studies prior to progressing into U.S. human trials. However, following the FDA's recognition of the established safety profile and standardization of production of HSA, the FDA allowed us to progress directly into U.S. human clinical trials. The FDA initially indicated that we should design and conduct two well-controlled trials with a 12 week primary endpoint measured on the Western Ontario and McMaster Universities Arthritis Index (WOMAC) pain subscale (WOMAC A). If we wished to request a chronic use label for Ampion[®], we would need to expose 1,500 patients to Ampion[®], including exposure of 300-600 patients for at least six months and 100 patients for at least one year, according to the FDA's ICH-E1A guidance.

In February 2013, in response to our Investigational New Drug (IND) application and two submissions describing two concurrent Phase III study protocols enrolling in excess of 1,600 patients, the FDA did not object to two sequential well-conducted trials in support of a license application. During 2013, we decided to switch Ampion to an acute label as we believe that this would be a more efficient and effective pathway to regulatory approval and require us to expose Ampion to fewer than 1,500 patients. Under such a development program the first trial would be a dose ranging trial, and the dose ranging trial objectives would be twofold: compare two volumes for efficacy and safety and demonstrate statistical power. We referred to the dose ranging trial as our SPRING study.

SPRING Pivotal Trial Results

On August 14, 2013, we announced results of the SPRING study of Ampion for the treatment of osteoarthritis of the knee. The SPRING study was a U.S. multicenter randomized (1:1:1:1), double-blind, vehicle controlled trial designed to evaluate the safety and efficacy of Ampion in osteoarthritis of knee patients. Three hundred twenty-nine patients were randomized to receive one of two doses (4 mL or 10 mL) of Ampion or corresponding saline control via intra-articular injection. The primary study objective was to evaluate the efficacy of Ampion versus placebo and to evaluate the efficacy of Ampion 4 mL versus Ampion 10 mL. The primary endpoint was change in pain as measured on the WOMAC A pain subscore, between Baseline and Week 12. Secondary objectives included evaluating safety, as well as stiffness and function. Both Ampion dose cohorts experienced statistically significant reductions in pain compared to control, and there were no significant differences between the efficacy of the two Ampion doses, as such, the lowest required dose, 4mL, was selected as the optimal dose. A brief summary of the SPRING study combined Ampion topline results is as follows:

Patients receiving Ampion achieved significantly greater reduction in pain, WOMAC A, from baseline to 12 weeks compared to saline vehicle control ($p = 0.004$).

Table of Contents

Patients receiving Ampion experienced, on average, a greater than 40% reduction in pain from baseline.

Patients receiving Ampion achieved significantly greater reduction in pain, WOMAC A, across 12 weeks compared to saline vehicle control ($p = 0.01$).

Patients receiving Ampion also achieved significantly greater improvement in function, (WOMAC C), from baseline to 12 weeks compared to saline vehicle control ($p = 0.044$).

Patients receiving Ampion also demonstrated significantly greater improvement in Patient Global Assessment (PGA) of disease severity from baseline to 12 weeks compared to saline vehicle control ($p = 0.012$).

Clinical efficacy defined as pain reduction was evident as early as four weeks after the injection ($p = 0.025$) and continued to show improvement through 12 weeks ($p = 0.0038$).

Severe patients, defined as Kellgren-Lawrence IV, receiving Ampion achieved significantly greater reduction in pain, WOMAC A, from baseline to 12 weeks compared to severe patients receiving saline vehicle control ($p = 0.017$).

Ampion was well tolerated with minimal adverse events (AEs) reported in the study. AEs were well balanced between Ampion and control groups. There were no drug-related serious adverse events (SAEs). On February 4, 2014, we announced that an article reporting the results was published in PLOSE ONE, an international, open-access, online publication. The article entitled: A Randomized Clinical Trial to Evaluate Two Doses of an Intra-Articular Injection of LMWF-5A in Adults with Pain Due to Osteoarthritis of the Knee details the efficacy and safety outcomes of the use of Ampion in the SPRING study.

Due to the robust results at week 12, we decided to amend the protocol to include an ad hoc visit at 20 weeks and called all subjects to come back in for a visit; 97 patients returned. At week twenty, 50% of patients in the Kellgren-Lawrence grades of 3 and 4 (severe osteoarthritis) had improvement of 40% or more in the WOMAC A pain scale compared to 25% in the vehicle control group ($p=0.04$). Patients were also classified as responders if they achieved 40% or greater improvement in pain, WOMAC A, and function, WOMAC C, at and over 20 weeks after a single intra-articular injection into the knee. In these same grade 3 and 4 patients, there was a statistically significant improvement in pain, WOMAC A, compared to the vehicle control both at week 20 ($p=0.02$) and over the whole period of 20 weeks ($p=0.005$). Also in these same grade 3 and 4 patients, there was a statistically significant improvement in function, WOMAC C, compared to vehicle control both at week 20 ($p=0.05$) and over the whole period of 20 weeks ($p=0.04$).

STEP Trial

On January 13, 2014, we announced the first patient injection in the Phase III clinical trial of Ampion for the treatment of osteoarthritis of the knee. The Phase III STEP study enrolled 538 patients and the primary endpoint was reduction in pain for patients treated with Ampion compared to vehicle control at 12 weeks. STEP was a randomized,

placebo-controlled, double-blind study in which patients with osteoarthritis knee pain were randomized to receive either a 4 mL single injection of Ampion or saline control. The clinical effects of treatment on osteoarthritic pain were evaluated during clinic visits at 6, 12, and 20 weeks using WOMAC Osteoarthritis Index and the Patient Global Assessment. Safety was assessed by recording adverse events, concomitant medications, physical examination, vital signs and clinical laboratory tests. Despite significant efforts that were successfully implemented in other studies, there was a break down in temperature management during the drug distribution process of the STEP Study. Based upon this deviation, the product efficacy data for the BLA will be drawn from the SPRING and Multiple Injection studies.

STRUT Trial

On June 30, 2014, we announced the beginning of a multiple injection study, the STRUT study, at a single site for patients with mostly severe or very severe osteoarthritis of the knee. The study is comprised of two phases; Phase I is an open-label, 7 patient, single center trial to analyze the safety of 4mL multiple injections (Baseline, Week 2 and Week 4) and Phase II is a randomized, 40 patient, single center trial to analyze the efficacy and safety of multiple injections (Baseline, Week 2 and Week 4). Phase II of the STRUT study would only commence after safety review of the Phase I trial results at 4 weeks. On August 5, 2014, we reported no serious drug related adverse events were reported in Phase I of the STRUT study and a 65% improvement in pain (WOMAC A pain subscore improved from 2.2 (0.55) to 0.8 (0.62), mean difference 1.43 (0.406) $p=0.001$) was observed at one month post-injection. In addition, the function score of WOMAC C improved by 74% compared to baseline at 4 weeks. With these positive results, Ampio proceeded with the randomized Phase II portion of the STRUT study. On October 16, 2014 we announced that enrollment was complete for Phase II of the STRUT study. On December 1, 2014, we announced the results from the Phase I open label portion of

Table of Contents

the study at 20 weeks. The primary endpoint, WOMAC A pain score, improved by 91.2% from baseline to 20 weeks in the Phase I open label portion of the study. Additionally, the WOMAC A mean (SD) significantly improved from 2.27 (0.59) at baseline, to 0.20 (0.23) at week 20, mean difference (95% CI) -2.03 (-2.83,-1.23), p=0.001. The secondary endpoint measurement of stiffness, also improved significantly by 87% from baseline at week 20 from mean (SD) of 2.75 (0.82) to 0.36 (0.48), mean difference (95% CI) 2.33 (-3.51,-1.15) p=0.004. The secondary endpoint of a validated measure of simple daily physical functions improved by 91.3% from baseline at week 20. This improvement was statistically significant, going from 2.32 (0.60) at baseline to 0.20 (0.34) at week 20; mean (95% CI) improvement of 2.09 (-2.96,-1.21), p=0.002. The 20 week data collection point from the Phase II randomized portion of the STRUT study will be completed in the first quarter of 2015.

STRIDE Trial

On October 16, 2014, we announced treatment had begun in the randomized (1:1), vehicle controlled, multiple injection (4mL at Baseline Week 2 and Week 4), multi-center STRIDE study with 320 patients. On November 12, 2014, we announced that 320 patients had been enrolled and received at least the first injection in the STRIDE study. We expect that the 20 week end point of this study will occur early in the second quarter of 2015.

Ampion Manufacturing Facility

In December 2013, we entered into a ten-year lease of a multi-purpose facility located in the Denver metropolitan area. Renovation began in January 2014 and we expect it will provide commercial scale, FDA compliant, state-of-the-art, cGMP manufacturing of Ampion, an advanced research and development laboratory as well as sufficient office space to consolidate operations of the Company in a single facility. As of December 31, 2014, we have estimated the total cost of the facility to be \$10.4 million. Our new manufacturing facility will initially provide registration batches of Ampion supporting the BLA. Once the manufacturing operation is approved by the FDA for commercial production, the facility is expected to have an annual production capacity of approximately ten million doses of Ampion. The raw material, HSA, required to manufacture Ampion has already been secured through a long-term, non-exclusive, supply agreement. In July 2014, we moved into our new headquarters, manufacturing and research facility. We expect the facility will be fully placed in service by the summer of 2015.

Future Development

We also intend to study Ampion for therapeutic applications outside of osteoarthritis of the knee. We expect to engage development partners to study Ampion in various conditions including: (i) acute and chronic inflammatory conditions; (ii) degenerative bone diseases; and (iii) respiratory and allergic disorders. Based on the continuing evaluation, we are also studying Ampion's effects on cellular behavior to indicate potential effects on disease modification across multiple conditions. If successful, we believe these additional formulations and potential therapeutic indications will supplement the Ampion clinical portfolio, and will enable clinical applications in large therapeutic markets where there are significant unmet needs. We expect that initial investigations into strategically attractive indications will be conducted on an investigator-sponsored basis.

OPTINA***Optina for Diabetic Macular Edema***

Optina is a low-dose formulation of danazol that we are developing to treat diabetic macular edema (DME). Danazol is a synthetic derivative of modified testosterone ethisterone, and we believe it affects vascular endothelial cell linkage in a biphasic manner. At low doses, danazol decreases vascular permeability by increasing the barrier function of

endothelial cells. The lipophilic low-molecular-weight weak androgen has the potential to treat multiple angiopathies.

Steroid hormones control a variety of functions through slow genomic and rapid non-genomic mechanisms. Danazol immediately increases intracellular cyclic adenosine monophosphate (cAMP) through the rapid activation of membrane-associated androgen, steroid binding globulin, and calcium channel receptors. At lower concentrations such as Optina, danazol binds to androgen and steroid binding globulin receptors stimulating the formation of a cortical actin ring. At higher concentrations, activation of the calcium channels shift the balance towards stress fiber formation and increase vascular permeability.

When organized into a cortical ring, filamentous actin (f-actin) increases the barrier function of endothelial cells by tethering adhesion molecule complexes to the cytoskeleton. In this orientation, increased cortical actin improves tight junctions which strengthen cell-to-cell adhesions. Formation of the cortical actin ring thereby restricts leakage across the cell membrane.

Table of Contents***Market Opportunity***

Type 1 and Type 2 diabetes mellitus affects 26 million people in the United States. One of the many symptoms of diabetes is the local and systemic inflammation of the microvascular system. Diabetic retinopathy is a complication of diabetes and is characterized by damage to the blood vessels of the retina and can either be proliferative or non-proliferative. Proliferative damage occurs when a reduction in oxygen levels in the retina due to impaired glucose metabolism causes fragile blood vessels to grow in the vitreous humor. Non-proliferative damage occurs when existing vessels experience poor endothelial cell linkage due to increased blood glucose levels and hypertension. Macular edema is the most common form of non-proliferative diabetic retinopathy. In diabetic macular edema, prolonged hyperglycemia compromises endothelial cell linkage leading to vascular permeability. The leakage of fluid, solutes, proteins and immune cells cause the macula to swell and thicken. This leads to damage of the central retinal tissue and can significantly impair sharp central vision. The prevalence of diabetes is 11.3% of the population above the age of 20, with an annual incidence of 1.9 million cases in the United States alone. In this population, the prevalence of diabetic macular edema is estimated at 30% of patients inflicted by the disease for 20 years or more.

Competition

There are no orally administered treatments for DME currently available nor to our knowledge are any being tested in clinical trials. The current standard of care in the U.S. for the treatment of DME is laser photocoagulation. The first and only approved therapy in the U.S. is intravitreal ranibizumab-injections. Ranibizumab belongs to a therapeutic class inhibiting vascular endothelial growth factor (anti-VEGF). It is important to note, there is significant competition from off-label anti-VEGF treatment of DME from bevacizumab. Iluvien, fluocinolone acetonide micro-insert intravitreal implant, is available in six European countries, and is pending approval in the United States while its sponsor reportedly resolves manufacturing issues. Dexamethasone intravitreal implant is available in the U.S. for macular edema following retinal vein occlusion and noninfectious uveitis and the product's sponsor has submitted for U.S. and European approval in the treatment of DME. Aflibercept, another anti-VEGF antibody treatment, is also awaiting U.S. and European approval in the treatment of DME.

Phase II results

In 2012, we concluded our Phase II randomized, double-masked, placebo-controlled, dose-ranging study evaluating the efficacy and safety of Optina in subjects with diabetic macular edema at St. Michael's Hospital in Toronto, Canada. The trial was randomized (1:1:1:1) and included 34 patients with moderate to severe diabetic macular edema (316-707 microns of central retinal thickness) which were treated orally with either one of three doses of Optina (5mg, 15mg, 45mg) twice a day (BID) or placebo for 12 weeks. The primary endpoint was mean central retinal thickness (CRT) measured by optical coherence tomography (OCT). Secondary endpoints included improvement in best corrected visual acuity (BCVA) and safety. On a pooled basis, Optina failed to demonstrate significant reduction in CRT versus placebo.

The trial was terminated early based on the review of the interim analysis data. No significant safety issues were identified, but the overall study design was complicated by the lipophilic nature of danazol. That lipophilic nature when combined with the critical nature of the blood level meant that the dose administered to all the patients needed to take Body Mass Index (BMI) into account. Patients who were randomly allocated to a dose not appropriate for their body mass did not contribute scientifically useful proof of efficacy or lack thereof. We, therefore, decided to terminate this study and initiate a redesigned study to evaluate the safety and efficacy of danazol dosing based on BMI.

However, recognizing danazol is very fat soluble, we subsequently stratified patients by BMI. These results produced a strong correlation between BMI and efficacy at the different doses of Optina. A brief summary of the topline results

is as follows:

Patients stratified around a BMI of 35 receiving Optina 15 mg BID achieved significant reduction in CRT (96.24 microns; $p=0.01$).

Patients stratified around a BMI of 26 receiving Optina 5 mg BID achieved a trend toward significant reduction in CRT (166.08 microns; $p=0.13$).

47% of patients receiving Optina improved at least one BCVA category.

Two serious adverse events were identified, one unlikely related and one unrelated to Optina. There were three treatment related adverse events (TRAEs) all of which were considered possibly related to Optina. Overall, patients receiving Optina achieved a reduction in CRT in a BMI dosage-adjusted manner at 12 weeks in the per-protocol population ($n=23$).

Table of Contents***Clinical Trials in Support of a §505(b)(2) New Drug Application (NDA)***

The FDA has indicated that, for §505(b)(2) NDAs, complete studies of the safety and effectiveness of a candidate product may not be necessary if appropriate bridging studies provide an adequate basis for reliance upon FDA's findings of safety and effectiveness for a previously approved product. On November 12, 2014, we announced the clinical trial in support of a §505(b)(2) application for Optina, OptimEyes, was complete and included 355 patients. The U.S. multicenter dose ranging trial was designed to evaluate the safety and efficacy of oral Optina compared with placebo over 12 weeks in adult patients with DME. The active treatment duration of 12 weeks was the maximum time allowed to withdraw treatment in the ophthalmology community. Patients were randomized (1:1:1) to receive one of two oral doses of Optina, 0.5 mg per BMI and 1.0 mg per BMI per day, or placebo. The primary endpoint was improvement in best-corrected visual acuity in treated patients compared to a placebo. Secondary endpoints are (i) measurements of changes in central macular thickness in treated patients compared to a placebo and (ii) safety and tolerability of the two Optina doses. Optina is a systemic therapy and the blood levels of danazol are affected by body composition. Therefore, blood levels of danazol play an important role in the interpretation of results. An independent laboratory has been engaged and is working to analyze the blood samples gathered during the clinical study. At this same time, our scientific and regulatory staff and our CRO were fully engaged in completing the Ampion STRUT and STRIDE clinical trials, it was decided to retain their focus on that effort rather than divide their attention. Once the Ampion clinical trials are complete and the outcome data reported to shareholders, management focus will be shifted back to compiling and reporting the Optina clinical trial results.

Additionally, patients from the active treatment arms of the trial were followed for four weeks without treatment following the 12 week treatment period in order to study any regression of effect. All patients were also given the option to enter into an open label extension of the trial. The open label study evaluated patients' improvement in BCVA over 12 weeks by administering the optimal dose of Optina. The optimal dose was determined by an interim analysis occurring at week 4 involving approximately 150 patients. We announced in October 2013 that an independent data review committee (IDRC) recommended the continuation of the study after an unmasked interim analysis which found that there was a treatment dosage demonstrating a potentially beneficial anatomic effect, and there were no significant safety concerns. Based on the outcome of the interim analysis, Ampio initiated an open label extension study for those patients who have completed the trial and wish to remain on Optina and offer patients who received placebo in the primary study a chance to cross-over to undergo treatment with the active treatment. The open label extension portion of the trial is now complete. This data should be released in conjunction with the primary study as noted above.

Future Development

While we believe the data from a single clinical trial could support a NDA filing, we will assess the need for an additional trial in conjunction with the FDA if we have a successful outcome of the trial in support of the §505(b)(2) NDA. The FDA has previously indicated that a Phase III trial may be necessary following the current trial. During this current trial, we also gathered data on patients' proteinuria levels. If Optina proves to be successful in inhibiting vascular permeability, we will assess the prospects of Optina for treatment of other diabetic angiopathies such as diabetic nephropathy.

NCE 001

Para-phenoxy-methylphenidate is a novel, small molecule methylphenidate derivative. Its basic mechanism of action is believed to be to increase methylation of the catalytic sub-unit of Protein Phosphatase 2 A (PP2A), with activation of this phosphatase achieving an effect similar to kinase inhibitors. PP2A is known to be largely involved in inflammation, angiogenesis, and cell proliferation, and by decreasing phosphorylation, the intracellular phosphatase

inhibits pro-carcinogenic cytokines and chemokines and cell signaling factors. Our pre-clinical research is focused on neuroblastoma, glioblastoma multiforme, renal cell carcinoma, and inflammatory breast cancer.

Subsidiaries

Luoxis Diagnostics, Inc.

Ampio owns 80.9% of Luoxis Diagnostics, Inc. Luoxis is an in-vitro diagnostics company focused on the development and global commercialization of RedoxSYS . This novel, diagnostic platform is comprised of a first-in-class, point-of-care device and disposable, testing strips that together measure the presence of oxidative stress and antioxidant reserves. To our knowledge, RedoxSYS is the only in-vitro diagnostic platform that measures human Oxidation-Reduction Potential (ORP), an important, complete measure of oxidative stress that is implicated in both critical and chronic illnesses. As demonstrated over decades in multiple, peer-reviewed publications. ORP is an important marker in the assessment of patient morbidity across a wide range of diseases and conditions. There are numerous clinical applications for this oxidative stress marker for which there is no currently available diagnostic test.

Table of Contents

In April of 2014, Luoxis obtained CE Marking in Europe for its RedoxSYS Diagnostic System, a blood-based platform for assessing the level of oxidative stress in the body. This regulatory clearance allows Luoxis to engage in strategic market development activities designed to establish the clinical utility of the RedoxSYS system in the critical care setting and position Luoxis for a launch in Europe, which is currently anticipated for 2015. Luoxis also obtained Health Canada Class II Medical Device approval for its RedoxSYS Diagnostic System which will allow development of the Canadian market. Luoxis entered into a research agreement with a global, US-based pharmaceutical company. Through this research agreement we will utilize our RedoxSYS oxidation-reduction potential (ORP) diagnostic system to assess the therapeutic effects of several investigational compounds with different target indications. The research agreement provides for Luoxis participation in multiple global studies being conducted by the pharmaceutical company. During 2014, Luoxis announced that the Company has expanded its academic and pharmaceutical research network to over 25 sites around the world. The Company has initiated over 17 scientific and clinical research studies, and Luoxis expects to initiate over 30 additional studies globally by the end of 2015. Luoxis has engaged over 12 academic research centers across North America and 13 sites in Europe including prominent centers in Belgium, England, France, Germany, Greece, and Wales. Further, to date Luoxis has also initiated research collaborations with five pharmaceutical companies in both the US and Europe, through which these companies are utilizing the RedoxSYS platform to perform drug development research on therapeutic candidates known to affect oxidative stress pathways. These studies span a broad range of therapeutic candidates in numerous disease areas.

Vyrix Pharmaceuticals, Inc.

Vyrix Pharmaceuticals, Inc. was formed on November 18, 2013 and is 100% owned by Ampio. Vyrix is a specialty pharmaceutical focused on developing and commercializing late-stage prescription pharmaceuticals to improve men's health and quality of life. The Company's most advanced product is Zertane, an oral drug in late stage development as treatment for PE. PE is a condition that has major impact on the quality of life for millions of men and their sexual partners. Vyrix is considering also the development of a combination product with Zertane and an erectile dysfunction product to address co-morbid PE and erectile dysfunction (ED).

In April of 2014, Vyrix entered into a Distribution and License Agreement (the *Paladin Agreement*) with Endo Ventures Limited, which recently acquired Paladin Labs Inc. (*Paladin*), whereby Paladin has exclusive rights to market, sell and distribute Zertane in Canada, the Republic of South Africa, certain countries in Sub Saharan Africa, Colombia and Latin America. The *Paladin Agreement* expires on a country by country basis the later of fifteen years after the first commercial sale of the product in that country or expiration of market exclusivity for Zertane in that country. *Paladin* paid \$250,000 to Vyrix upon signing the *Paladin Agreement* and may make milestone payments aggregating up to \$3,025,000 based upon achieving Canadian and South African product regulatory approval and achieving specific sales goals. In addition, the *Paladin Agreement* provides that *Paladin* pay royalties based on sales volume. During 2014, Vyrix filed a Form S-1 with the Securities and Exchange Commission relating to a proposed initial public offering of Vyrix common stock. The Company continues to explore strategic alternatives with Vyrix but due to market conditions we have decided to delay the potential initial public offering of Vyrix. Based upon the uncertainty of when or if we will be able to complete the initial public offering of Vyrix, the Company has expensed all of the costs that we have incurred related to the preparation of this potential transaction. The Company still intends to initiate the Phase 3 clinical trials to enable a New Drug Application submission following completion of the necessary trials. Funding for the trials is expected to come from Ampio as well as other sources which have not been identified.

Government Regulation

FDA Approval Process

In the United States, pharmaceutical products are subject to extensive regulation by the FDA. The Federal Food, Drug, and Cosmetic Act, or the FDC Act, and other federal and state statutes and regulations, govern, among other things, the research, development, testing, manufacture, storage, recordkeeping, approval, labeling, promotion and marketing, distribution, post-approval monitoring and reporting, sampling, and import and export of pharmaceutical products. Failure to comply with applicable U.S. requirements may subject a company to a variety of administrative or judicial sanctions, such as FDA refusal to approve pending NDAs, warning letters, product recalls, product seizures, total or partial suspension of production or distribution, injunctions, fines, civil penalties, and criminal prosecution.

Pharmaceutical and biologic product development in the US typically involves the performance of satisfactory preclinical laboratory and animal studies under the FDA's Good Laboratory Practices (GLPs) regulation, the development and demonstration of manufacturing processes which conform to FDA mandated current good manufacturing practices, or cGMP, a quality system

Table of Contents

regulating manufacturing, the submission and acceptance of an IND application which must become effective before human clinical trials may begin in the US, obtaining the approval of Institutional Review Boards (IRBs) at each site where we plan to conduct a clinical trial to protect the welfare and rights of human subjects in clinical trials, adequate and well-controlled clinical trials to establish the safety and effectiveness of the drug or biologic for each indication for which FDA approval is sought, and the submission to the FDA for review and approval of a NDA or BLA. Satisfaction of FDA pre-market approval requirements typically takes many years and the actual time required may vary substantially based upon the type, complexity, and novelty of the product or disease. Preclinical tests generally include laboratory evaluation of a product candidate, its chemistry, formulation, stability and toxicity, as well as certain animal studies to assess its potential safety and efficacy. Results of these preclinical tests, together with manufacturing information (in compliance with GLP and cGMP), analytical data and the clinical trial protocol (detailing the objectives of the trial, the parameters to be used in monitoring safety, and the effectiveness criteria to be evaluated), must be submitted to the FDA as part of an IND, which must become effective before human clinical trials can begin.

An IND automatically becomes effective 30 days after receipt by the FDA, unless the FDA, within the 30-day time period, raises concerns or questions about the intended conduct of the trials and imposes what is referred to as a clinical hold. Preclinical studies generally take several years to complete, and there is no guarantee that an IND based on those studies will become effective, allowing clinical testing to begin. In addition to FDA review of an IND, each medical site that desires to participate in a proposed clinical trial must have the protocol reviewed and approved by an independent IRB or Ethics Committee (EC). The IRB considers, among other things, ethical factors, and the selection and safety of human subjects. Clinical trials must be conducted in accordance with the FDA's Good Clinical Practices (GCP) requirements. The FDA and/or IRB/EC may order the temporary, or permanent, discontinuation of a clinical trial or a specific clinical trial site to be halted at any time, or impose other sanctions for failure to comply with requirements under the appropriate entity jurisdiction.

Clinical Trials to support NDAs and BLAs for marketing approval are typically conducted in three sequential phases, but the phases may overlap. In Phase 1 clinical trials, a product candidate is typically introduced either into healthy human subjects or patients with the medical condition for which the new drug is intended to be used. The main purpose of the trial is to assess a product candidate's safety and the ability of the human body to tolerate the product candidate. Phase 1 clinical trials generally include less than 50 subjects or patients. During Phase II trials, a product candidate is studied in an exploratory trial or trials in a limited number of patients with the disease or medical condition for which it is intended to be used in order to: (i) further identify any possible adverse side effects and safety risks, (ii) assess the preliminary or potential efficacy of the product candidate for specific target diseases or medical conditions, and (iii) assess dosage tolerance and determine the optimal dose for Phase 3 trial. Phase 3 trials are generally undertaken to demonstrate clinical efficacy and to further test for safety in an expanded patient population with the goal of evaluating the overall risk-benefit relationship of the product candidate. Phase 3 trials will generally be designed to reach a specific goal or endpoint, the achievement of which is intended to demonstrate the candidate product's clinical efficacy and adequate information for labeling of the drug or biologic.

After completion of the required clinical testing, a NDA or BLA is prepared and submitted to the FDA. FDA approval of the NDA or BLA is required before marketing of the product may begin in the U.S. The NDA must include the results of all preclinical, clinical, and other testing and a compilation of data relating to the product's pharmacology, chemistry, manufacture, and controls. The cost of preparing and submitting a NDA is substantial. Under federal law, the submission of most NDAs is additionally subject to a substantial application user fee, currently exceeding \$2.3 million and the manufacturer and/or sponsor under an approved NDA are also subject to annual product and establishment user fees, currently approximately \$0.1 million per product and \$0.6 million per establishment. These fees are typically increased annually. The FDA will waive the application fee for the first human drug application that a small business or its affiliate submits for review (section 736(d)(1)(E) of the FD&C Act).

The FDA has 60 days from its receipt of a NDA to determine whether the application will be accepted for filing based on the FDA's threshold determination that it is sufficiently complete to permit substantive review. Once the submission is accepted for filing, the FDA begins an in-depth review. The FDA has agreed to certain performance goals in the review of NDAs. Most such applications for standard review drug products are reviewed within ten months; most applications for priority review drugs are reviewed in six months. The review process for both standard and priority review may be extended by FDA for three additional months to consider certain late-submitted information, or information intended to clarify information already provided in the submission. The FDA may also refer applications for novel drug products, or drug products which present difficult questions of safety or efficacy, to an advisory committee—typically a panel that includes clinicians and other experts—for review, evaluation, and a recommendation as to whether the application should be approved. The FDA is not bound by the recommendation of an advisory committee, but it generally follows such recommendations. Before approving a NDA, the FDA will typically inspect one or more clinical sites to assure compliance with GCP. Additionally, the FDA will inspect the facility or the facilities at which the drug is manufactured. The FDA will not approve the product unless compliance with cGMP is satisfactory and the NDA contains data that provide substantial evidence that the drug is safe and effective in the indication studied.

After FDA evaluates the NDA and the manufacturing facilities, it issues either an approval letter or a complete response letter. A complete response letter generally outlines the deficiencies in the submission and may require substantial additional testing or

Table of Contents

information in order for the FDA to reconsider the application. If, or when, those deficiencies have been addressed to the FDA's satisfaction in a resubmission of the NDA, the FDA will issue an approval letter. FDA has committed to reviewing such resubmissions in two or six months depending on the type of information included. An approval letter authorizes commercial marketing of the drug with specific prescribing information for specific indications. As a condition of NDA approval, the FDA may require a risk evaluation and mitigation strategy, or REMS, to help ensure that the benefits of the drug outweigh the potential risks. REMS can include medication guides, communication plans for healthcare professionals, and elements to assure safe use, or ETASU. ETASU can include, but are not limited to, special training or certification for prescribing or dispensing, dispensing only under certain circumstances, special monitoring, and the use of patient registries. The requirement for a REMS can materially affect the potential market and profitability of the drug. Moreover, product approval may require substantial post-approval testing and surveillance to monitor the drug's safety or efficacy. Once granted, product approvals may be withdrawn if compliance with regulatory standards is not maintained or problems are identified following initial marketing.

Fast Track Designation

The FDA has developed Fast Track policies, which provide the potential for expedited review of a NDA. Fast Track status is potentially provided only for those new and novel therapies that are intended to treat persons with life-threatening and severely debilitating diseases where there is a defined unmet medical need, especially where no satisfactory alternative therapy exists or the new therapy is significantly superior to alternative therapies. During the development of product candidates that qualify for this status, the FDA may expedite consultations and reviews of these experimental therapies. Fast Track status also provides the potential for a product candidate to have a Priority Review. A Priority Review allows for portions of the NDA to be submitted to the FDA for review prior to the completion of the entire application, which could result in a reduction in the length of time it would otherwise take the FDA to complete its review of the NDA. Fast Track status may be revoked by the FDA at any time if the clinical results of a trial fail to continue to support the assertion that the respective product candidate has the potential to address and unmet medical need. For biologics, priority review is further limited only for therapies intended to treat a serious or life threatening disease.

Orphan Drug Designation

The FDA may grant Orphan Drug status to drugs intended to treat a rare disease or condition, which is generally a disease or condition that affects fewer than 200,000 individuals in the United States. If and when the FDA grants Orphan Drug status, the generic name and trade name of the therapeutic agent and its potential orphan use are disclosed publicly by the FDA. Aside from guidance concerning the non-clinical laboratory studies and clinical investigations necessary for approval of the NDA, Orphan Drug status does not convey any advantage in, or shorten the duration of, the regulatory review and approval process. The FDA may grant Orphan Drug status to multiple competing product candidates targeting the same indications. A product that has been designated as an Orphan Drug that subsequently receives the first FDA approval is entitled to Orphan Drug exclusivity. This exclusivity means the FDA may not approve any other applications to market the same drug for the same indication, except in very limited circumstances, for seven years from the date of the initial FDA approval. Orphan Drug approval may also provide certain tax benefits to the company that receives the first FDA approval. Finally, the FDA may fund the development of orphan products through its grants program for clinical studies.

Breakthrough Designation

Breakthrough therapy designation is intended to expedite the development and review of drugs for serious or life-threatening conditions. The criteria for breakthrough therapy designation require preliminary clinical evidence that demonstrates the drug may have substantial improvement for at least one clinically significant endpoint compared

to available therapy. A breakthrough therapy designation conveys all of the fast track program features, as well as more intensive FDA guidance on an efficient drug development program. The FDA also has an organizational commitment to involve senior management in such guidance.

Accelerated Approval

Under the FDA's accelerated approval regulations, the FDA may approve a drug for a serious or life-threatening illness that provides meaningful therapeutic benefit to patients compared to existing treatments based upon a surrogate endpoint that is reasonably likely to predict clinical benefit. In clinical trials, a surrogate endpoint is a measurement of laboratory tests or clinical signs of a disease or condition that substitutes for a direct measurement of how a patient feels, functions, or survives. Surrogate endpoints can often be measured more easily or more rapidly than clinical endpoints. A drug candidate approved on this basis is subject to rigorous post-marketing compliance requirements, including the completion of Phase 4 or post-approval clinical trials to confirm the predictability of surrogate endpoints for clinical outcomes. Failure to conduct required post-approval studies, or confirm a clinical benefit during post-marketing studies, will allow the FDA to withdraw the drug from the market on an expedited basis. All promotional materials for drug candidates approved under accelerated regulations are subject to prior review by the FDA.

Table of Contents

Foreign Regulatory Approval

Outside of the United States, our ability to market our product candidates will be contingent upon our receiving marketing authorizations from the appropriate foreign regulatory authorities, whether or not FDA approval has been obtained. The foreign regulatory approval process in most industrialized countries generally encompasses risks similar to those we will encounter in the FDA approval process. The requirements governing conduct of clinical trials and marketing authorizations, and the time required to obtain requisite approvals, may vary widely from country to country and differ from that required for FDA approval.

Under European Union regulatory systems, marketing authorizations may be submitted either under a centralized or decentralized procedure. The centralized procedure provides for the grant of a single marketing authorization that is valid for all European Union member states. The decentralized procedure provides for mutual recognition of national approval decisions. Under this procedure, the holder of a national marketing authorization may submit an application to the remaining member states. Within 90 days of receiving the applications and assessment report, each member state must decide whether to recognize approval. The mutual recognition process results in separate national marketing authorizations in the reference member state and each concerned member state. We will seek to choose the appropriate route of European regulatory filing in an attempt to accomplish the most rapid regulatory approvals for our product candidates when ready for review. However, the chosen regulatory strategy may not secure regulatory approvals or approvals of the chosen product indications. In addition, these approvals, if obtained, may take longer than anticipated. We can provide no assurance that any of our product candidates will prove to be safe or effective, will receive required regulatory approvals, or will be successfully commercialized.

The Hatch-Waxman Act

In seeking approval for a drug through a NDA, applicants are required to list with the FDA each patent whose claims cover the applicant's product. Upon approval of a drug, each of the patents listed in the application for the drug is then published in the FDA's Approved Drug Products with Therapeutic Equivalence Evaluations, commonly known as the Orange Book. Drugs listed in the Orange Book can, in turn, be cited by potential competitors in support of approval of an abbreviated new drug application, or (ANDA). An ANDA provides for marketing of a drug product that has the same active ingredients in the same strengths and dosage form as the listed drug and has been shown through bioequivalence testing to be therapeutically equivalent to the listed drug. Other than the requirement for bioequivalence testing, ANDA applicants are not required to conduct, or submit results of, pre-clinical or clinical tests to prove the safety or effectiveness of their drug product. Drugs approved in this way are commonly referred to as generic equivalents to the listed drug, and can often be substituted by pharmacists under prescriptions written for the original listed drug.

The ANDA applicant is required to certify to the FDA concerning any patents listed for the approved product in the FDA's Orange Book. Specifically, the applicant must certify that: 1) the required patent information has not been filed; 2) the listed patent has expired; 3) the listed patent has not expired, but will expire on a particular date and approval is sought after patent expiration; or 4) the listed patent is invalid or will not be infringed by the new product. A certification that the new product will not infringe the already approved product's listed patents, or that such patents are invalid, is called a Paragraph IV certification. If the applicant does not challenge the listed patents, the ANDA application will not be approved until all the listed patents claiming the referenced product have expired.

If the ANDA applicant has provided a Paragraph IV certification to the FDA, the applicant must also send notice of the Paragraph IV certification to the NDA and patent holders once the ANDA has been accepted for filing by the FDA. The NDA and patent holders may then initiate a patent infringement lawsuit in response to the notice of the Paragraph IV certification. The filing of a patent infringement lawsuit within 45 days of the receipt of a Paragraph IV

certification automatically prevents the FDA from approving the ANDA until the earlier of 30 months, expiration of the patent, settlement of the lawsuit, or a decision in the infringement case that is favorable to the ANDA applicant.

The ANDA application also will not be approved until any non-patent exclusivity listed in the Orange Book for the referenced product has expired. Federal law provides a period of five years following approval of a drug containing no previously approved active ingredients during which ANDAs for generic versions of those drugs cannot be submitted, unless the submission contains a Paragraph IV challenge to a listed patent in which case the submission may be made four years following the original product approval. Federal law provides for a period of three years of exclusivity during which FDA cannot grant effective approval of an ANDA based on the approval of a listed drug that contains previously approved active ingredients but is approved in a new dosage form, route of administration or combination, or for a new use; the approval of which was required to be supported by new clinical trials conducted by, or for, the applicant.

Post-Approval Regulation

Even if a product candidate receives regulatory approval, the approval is typically limited to specific clinical indications. Further, even after regulatory approval is obtained, subsequent discovery of previously unknown problems with a product may result in restrictions

Table of Contents

on its use or even complete withdrawal of the product from the market. Any FDA-approved products manufactured or distributed by us are subject to continuing regulation by the FDA, including record-keeping requirements and reporting of adverse events or experiences. Further, drug manufacturers and their subcontractors are required to register their establishments with the FDA and state agencies, and are subject to periodic inspections by the FDA and state agencies for compliance with cGMP, which impose rigorous procedural and documentation requirements upon us and our contract manufacturers. We cannot be certain that we or our present or future contract manufacturers or suppliers will be able to comply with cGMP regulations and other FDA regulatory requirements. Failure to comply with these requirements may result in, among other things, total or partial suspension of production activities, failure of the FDA to grant approval for marketing, and withdrawal, suspension, or revocation of marketing approvals.

If the FDA approves one or more of our product candidates, we and the contract manufacturers we use for manufacture of clinical supplies and commercial supplies must provide certain updated safety and efficacy information. Product changes, as well as certain changes in the manufacturing process or facilities where the manufacturing occurs or other post-approval changes may necessitate additional FDA review and approval. The labeling, advertising, promotion, marketing and distribution of a drug or biologic product also must be in compliance with FDA and Federal Trade Commission (FTC) requirements which include, among others, standards and regulations for direct-to-consumer advertising, off-label promotion, industry sponsored scientific and educational activities, and promotional activities involving the Internet. The FDA and FTC have very broad enforcement authority, and failure to abide by these regulations can result in penalties, including the issuance of a warning letter directing us to correct deviations from regulatory standards and enforcement actions that can include seizures, fines, injunctions and criminal prosecution.

Other Regulatory Requirements

We are also subject to regulation by other regional, national, state and local agencies, including the U.S. Department of Justice, the Office of Inspector General of the U.S. Department of Health and Human Services and other regulatory bodies. Our current and future partners are subject to many of the same requirements.

In addition, we are subject to other regulations, including regulations under the Occupational Safety and Health Act, regulations promulgated by the U.S. Drug Enforcement Administration, or DEA, the Toxic Substance Control Act, the Resource Conservation and Recovery Act, and regulations under other federal, state and local laws.

Violations of any of the foregoing requirements could result in penalties being assessed against us.

Privacy

Most health care providers, including research institutions from whom we or our partners obtain patient information, are subject to privacy and security rules under the Health Insurance Portability and Accountability Act of 1996, or HIPAA, and the recent amendments to HIPAA under the Health Information Technology for Economic and Clinical Health Act, or HITECH. Additionally, strict personal privacy laws in other countries affect pharmaceutical companies activities in other countries. Such laws include the European Union, or EU, Directive 95/46/EC on the protection of individuals with regard to the processing of personal data, as well as individual EU Member States, implementing laws and additional laws. Although our clinical development efforts are not barred by these privacy regulations, we could face substantial criminal penalties if we knowingly receive individually identifiable health information from a health care provider that has not satisfied HIPAA s or the EU s disclosure standards. Failure by EU clinical trial partners to obey requirements of national laws on private personal data, including laws implementing the EU Data Protection Directive, might result in liability and/or adverse publicity.

Information Systems

We believe that our Information Systems, or IS, capabilities are adequate to manage our core business and our internal controls related to IS are operating effectively.

Intellectual Property Summary

Ampion

As of December 31, 2014, the current Ampion patent portfolio consists of 51 issued patents and 79 pending applications worldwide. The portfolio primarily consists of six families filed in the United States and throughout the world. The first family includes six issued U.S. patents and one issued European Patent Office (EPO) patent validated in 19 countries with claims relating to methods of treating inflammatory disease and compositions of matter comprising diketopiperazine derivatives, including DA-DKP. This family also includes issued patents in Canada, China, Hong Kong, Japan and South Africa and one pending application in the U.S. The standard 20-year expiration for patents in this family is in 2021.

Table of Contents

The second family includes five issued U.S. patents with claims directed to methods of treating inflammation and T-cell mediated or inflammatory diseases with compositions of matter comprising DA-DKP. This family also includes issued patents in Australia, China, India, New Zealand, Singapore, Hong Kong, Israel, and South Africa and pending applications in the U.S., Australia, Canada, China, EPO, Israel, Japan, Korea and Hong Kong. The standard 20-year expiration for patents in this family is in 2024.

The third family includes one pending United States application and a Patent Cooperation Treaty (PCT) international application with claims directed to the use of DA-DKP for the treatment of degenerative joint diseases. The standard 20-year expiration for patents in this family is in 2032.

The fourth family includes one pending United States application and a Patent Cooperation Treaty (PCT) international application with claims directed to the use of DA-DKP to mobilize, home, expand and differentiate stem cells in the treatment of subjects. The standard 20-year expiration for patents in this family is in 2034.

The fifth family includes one Patent Cooperation Treaty (PCT) international application with claims directed to methods for the manufacture of DA-DKP containing compositions. The standard 20-year expiration for patents in this family is in 2034.

The sixth family includes one pending United States provisional application with claims directed to the use of DA-DKP for the treatment of degenerative joint diseases in a multi-dose treatment regimen. The standard 20-year expiration for patents in this family is in 2035.

Optina

As of December 31, 2014, the Optina patent portfolio currently consists of 107 issued patents and 39 pending applications worldwide. The portfolio consists primarily of three patent families, the first and second of which include claims for the use of low doses of danazol to treat conditions associated with vascular hyperpermeability. These two families include issued patents in the U.S., EPO (validated in 36 countries and Hong Kong), Germany, South Africa, Singapore and Canada with claims relating to methods of treating macular edema with danazol. These families also include pending applications in Australia, Brazil, China, Canada, Eurasian Patent Organization, EPO, Indonesia, Israel, Japan, Korea, Mexico, Malaysia, New Zealand, Philippines, Singapore, Hong Kong and the United States. The standard 20-year expiration for patents in these families is in 2030. The third family is for the treatment of conditions associated with vascular hyperpermeability with low doses of danazol that correspond to the body fat content of the patient. The standard 20-year expiration for patents in this family is in 2033.

Luoxis

As of December 31, 2014, the current Luoxis patent portfolio consists of 27 issued patents and 50 pending applications worldwide. The portfolio primarily consists of four families filed in the United States and throughout the world. The first family includes three issued patents and six pending applications with claims directed to the measurement of the oxidation reduction potential (ORP) of a patient sample to evaluate various conditions. The standard 20-year expiration for patents in this family is in 2028. The second family includes two pending United States applications, pending applications in Canada, Singapore, South Africa and Australia and a PCT international application with claims directed to the measurement of the ORP capacity of a patient sample to evaluate various conditions. The standard 20-year expiration for patents in this family is in 2033.

The third family includes five issued patents and 18 pending applications with claims directed to devices and methods for the measurement of ORP and ORP capacity. The standard 20-year expiration for patents in this family is in 2032.

The fourth family includes one pending United States application and 16 pending applications worldwide with claims directed to multiple layer gel test strip measurement devices and methods of making for use in measuring ORP and ORP capacity. The standard 20-year expiration for patents in this family is in 2033.

Vyrix Pharmaceuticals

As of December 31, 2014, the current Vyrix patent portfolio consists of 77 issued patents and 15 pending applications worldwide. The portfolio primarily consists of three families filed in the United States and throughout the world. The first family includes 30 issued patents for the use of tramadol to treat premature ejaculation. The standard 20-year expiration for patents in this family is in 2022. The other two families are for the use of a combination of tramadol and a phosphodiesterase inhibitor to treat comorbid premature

Table of Contents

ejaculation and erectile dysfunction and to treat sexual dysfunction side effects associated with administration of tramadol. These two families include issued patents in Europe, Australia, Canada, China, Mexico, New Zealand, Japan, the Philippines and South Africa and pending applications in the United States, Brazil, China, India, Japan, Korea, and the Philippines. The standard 20-year expiration for patents in these families is in 2028.

Barriers of Entry General

We also maintain trade secrets and proprietary know-how that we seek to protect through confidentiality and nondisclosure agreements. We expect to seek United States and foreign patent protection for drug and diagnostic products we discover, as well as therapeutic and diagnostic products and processes. We expect also to seek patent protection or rely upon trade secret rights to protect certain other technologies which may be used to discover and characterize drugs and diagnostic products and processes, and which may be used to develop novel therapeutic and diagnostic products and processes. These agreements may not provide meaningful protection or adequate remedies in the event of unauthorized use or disclosure of confidential and proprietary information. If we do not adequately protect our trade secrets and proprietary know-how, our competitive position and business prospects could be materially harmed.

The patent positions of companies such as ours involve complex legal and factual questions and, therefore, their enforceability cannot be predicted with any certainty. Our issued and licensed patents, and those that may be issued to us in the future, may be challenged, invalidated or circumvented, and the rights granted under the patents or licenses may not provide us with meaningful protection or competitive advantages. Our competitors may independently develop similar technologies or duplicate any technology developed by us, which could offset any advantages we might otherwise realize from our intellectual property. Furthermore, even if our product candidates receive regulatory approval, the time required for development, testing, and regulatory review could mean that protection afforded us by our patents may only remain in effect for a short period after commercialization. The expiration of patents or license rights we hold could adversely affect our ability to successfully commercialize our pharmaceutical drugs or diagnostics, thus harming our operating results and financial position.

We will be able to protect our proprietary intellectual property rights from unauthorized use by third parties only to the extent that such rights are covered by valid and enforceable patents or are effectively maintained as trade secrets. If we must litigate to protect our intellectual property from infringement, we may incur substantial costs and our officers may be forced to devote significant time to litigation-related matters. The laws of certain foreign countries do not protect intellectual property rights to the same extent as do the laws of the United States.

Our pending patent applications, or those we may file or license from third parties in the future, may not result in patents being issued. Until a patent is issued, the claims covered by an application for patent may be narrowed or removed entirely, thus depriving us of adequate protection. As a result, we may face unanticipated competition, or conclude that without patent rights the risk of bringing product candidates to market exceeds the returns we are likely to obtain. We are generally aware of the scientific research being conducted in the areas in which we focus our research and development efforts, but patent applications filed by others are maintained in secrecy for at least 18 months and, in some cases in the United States, until the patent is issued. The publication of discoveries in scientific literature often occurs substantially later than the date on which the underlying discoveries were made. As a result, it is possible that patent applications for products similar to our drug or diagnostic candidates may have already been filed by others without our knowledge.

The biotechnology and pharmaceutical industries are characterized by extensive litigation regarding patents and other intellectual property rights, and it is possible that our development of product candidates could be challenged by other pharmaceutical or biotechnology companies. If we become involved in litigation concerning the enforceability, scope

and validity of the proprietary rights of others, we may incur significant litigation or licensing expenses, be prevented from further developing or commercializing a product candidate, be required to seek licenses that may not be available from third parties on commercially acceptable terms, if at all, or subject us to compensatory or punitive damage awards. Any of these consequences could materially harm our business.

Competition

The biotechnology and pharmaceutical industries are highly competitive and subject to significant and rapid technological change as researchers learn more about diseases and develop new technologies and treatments. Significant competitive factors in our industry include product efficacy and safety; quality and breadth of an organization's technology; skill of an organization's employees and its ability to recruit and retain key employees; timing and scope of regulatory approvals; government reimbursement rates for, and the average selling price of, products; the availability of raw materials and qualified manufacturing capacity; manufacturing costs; intellectual property and patent rights and their protection; and sales and marketing capabilities.

Table of Contents

We cannot assure you that any of our products that we successfully develop will be clinically superior or scientifically preferable to products developed or introduced by our competitors.

Many of our actual and potential competitors have substantially longer operating histories and possess greater name recognition, product portfolios, and significantly greater experience in discovering, developing, manufacturing, and marketing products as well as financial, research, and marketing resources than us. Among our smaller competitors, many of these companies have established co-development and collaboration relationships with larger pharmaceutical and biotechnology firms, which may make it more difficult for us to attract strategic partners. Our current and potential competitors include major multinational pharmaceutical companies, biotechnology firms, universities and research institutions. Some of these companies and institutions, either alone or together with their collaborators, have substantially greater financial resources and larger research and development staffs than do we. In addition, many of these competitors, either alone or together with their collaborators, have significantly greater experience than us in discovering, developing, manufacturing, and marketing pharmaceutical products and diagnostics. If one of our competitors realizes a significant advance in pharmaceutical drugs or diagnostics that address one or more of the diseases targeted by our product candidates, our products or diagnostics could be rendered uncompetitive or obsolete.

Our competitors may also succeed in obtaining FDA or other regulatory approvals for their product candidates more rapidly than we are able to do, which could place us at a significant competitive disadvantage or deny us marketing exclusivity rights. Market acceptance of our product or diagnostic candidates will depend on a number of factors, including: (i) potential advantages over existing or alternative therapies or tests, (ii) the actual or perceived safety of similar classes of products, (iii) the effectiveness of sales, marketing, and distribution capabilities, and (iv) the scope of any approval provided by the FDA or foreign regulatory authorities.

Although we believe our product candidates possess attractive attributes, we cannot assure you that our product candidates will achieve regulatory or market acceptance, or that we will be able to compete effectively in the pharmaceutical drug or diagnostic markets. If our product candidates fail to gain regulatory approvals and acceptance in their intended markets, we may not generate meaningful revenues or achieve profitability.

Research and Development

Our strategy is to minimize fixed overhead by outsourcing much of our research and development activities. Through a sponsored research agreement, our discovery activities are conducted by Trauma Research LLC, or TRLLC, a limited liability company owned by Dr. David Bar-Or. Under the research agreement, TRLLC conducts drug and biomarker discovery and development programs at its research facilities, and we provide funding and some scientific personnel. Intellectual property from discovery programs conducted by TRLLC on our behalf belongs to us, and we are solely responsible for protecting that intellectual property. While we have the right to generally request development work under the research agreement, TRLLC directs such work and is responsible for how the work is performed.

For the years ended December 31, 2014, 2013 and 2012, we recorded \$26.9 million, \$16.6 million, and \$6.0 million, respectively, of research and development expenses. Research and development expenses represented 68.8%, 68.9%, and 50.9% of total operating expenses in the years ended December 31, 2014, 2013 and 2012, respectively. More information regarding our research and development activities can be found in the section entitled "Management's Discussion and Analysis of Financial Condition and Results of Operations" under Item 7 of this Annual Report.

Ampio Manufacturing Facility

In December 2013, we entered into a ten-year lease of a multi-purpose facility located in the Denver metropolitan area. Renovation began in January 2014 and we expect it will provide commercial scale, FDA compliant, state-of-the-art, cGMP manufacturing of Ampion, an advanced research and development laboratory as well as sufficient office space to consolidate operations of the Company in a single facility. As of December 31, 2014, we have estimated the total cost of the facility to be \$10.4 million. Our new manufacturing facility will initially provide registration batches of Ampion supporting the BLA. Once the manufacturing operation is approved by the FDA for commercial production, the facility is expected to have an annual production capacity of approximately ten million doses of Ampion. The raw material, HSA, required to manufacture Ampion has already been secured through a long-term, non-exclusive, supply agreement. In July 2014, we moved into our new headquarters, manufacturing and research facility. We expect the facility will be fully placed in service by the summer of 2015.

Our business strategy for Optina is to use cGMP compliant contract manufacturers for manufacture of clinical supplies as well as for commercial supplies if required by our commercialization plans, and to transfer manufacturing responsibility to our collaboration partners when possible.

Table of Contents

Compliance with Environmental Laws

We believe we are in compliance with current material environmental protection requirements that apply to us or our business. Costs attributable to environmental compliance are not currently material.

Product Liability and Insurance

The development, manufacture and sale of pharmaceutical products involve inherent risks of adverse side effects or reactions that can cause bodily injury or even death. Product candidates we succeed in commercializing could adversely affect consumers even after obtaining regulatory approval and, if so, we could be required to withdraw a product from the market or be subject to administrative or other proceedings. As we are not now manufacturing, marketing or distributing pharmaceutical products or diagnostics, we have elected not to obtain product liability insurance at the current time. We obtain clinical trial liability coverage for human clinical trials, and will obtain appropriate product liability insurance coverage for products we manufacture and sell for human consumption. The amount, nature and pricing of such insurance coverage will likely vary due to a number of factors such as the product candidate's clinical profile, efficacy and safety record, and other characteristics. We may not be able to obtain sufficient insurance coverage to address our exposure to product recall or liability actions, or the cost of that coverage may be such that we will be limited in the types or amount of coverage we can obtain. Any uninsured loss we suffer could materially and adversely affect our business and financial position.

Employees

As of February 1, 2015, we had 23 full-time employees and utilized the services of a number of consultants on a temporary basis. Overall, we have not experienced any work stoppage and do not anticipate any work stoppage in the foreseeable future. Management believes that relations with our employees are good.

Available Information

Our principal executive offices are located at 373 Inverness Parkway, Suite 200, Englewood, Colorado 80112 USA, and our phone number is (720) 437-6500.

We maintain a website on the internet at www.ampiopharma.com. We make available free of charge through our website, by way of a hyperlink to a third-party site that includes filings we make with the SEC website (www.sec.gov), our annual reports on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to those reports electronically filed or furnished pursuant to Section 15(d) of the Exchange Act. The information on our website is not, and shall not be deemed to be, a part of this annual report on Form 10-K or incorporated into any other filings we make with the SEC. In addition, the public may read and copy any materials we file with the SEC at the SEC's Public Reference Room at 100 F Street, N.E., Washington D.C., 20549. Information on the operation of the Public Reference Room may be obtained by calling the SEC at 1-800-SEC-0330. Our Code of Conduct and Ethics and the charters of our Nominating and Governance Committee, Audit Committee, and Compensation Committee of our Board of Directors may be accessed within the Investor Relations section of our website. Amendments and waivers of the Code of Conduct and Ethics will also be disclosed within four business days of issuance on the website. Information found in our website is neither part of this annual report on Form 10-K nor any other report filed with the SEC.

Item 1A. Risk Factors

Risks Related to Our Business

We have incurred significant losses since inception, expect to incur net losses for at least the next several years and may never achieve or sustain profitability.

We have experienced significant net losses since inception. As of December 31, 2014, we had an accumulated deficit of \$101.9 million. We expect our annual net losses could continue over the next several years as we advance our development programs and incur significant clinical development costs.

We have not received, and do not currently expect to receive, any revenues from the commercialization of our product candidates in the near term. In September 2011, we entered into a license, development and commercialization agreement with a major Korean pharmaceutical company with respect to Zertane in South Korea, which provided for a \$500,000 upfront payment and future milestone payments that are contingent upon achievement of regulatory approvals and cumulative net sales targets. In April 2014, Vyrix entered into a Distribution and License Agreement (the *Paladin Agreement*) with Endo Ventures Limited, which recently acquired Paladin Labs Inc. (*Paladin*), whereby Paladin has exclusive rights to market, sell and distribute Zertane in Canada, the Republic of South Africa, certain countries in Sub Saharan Africa, Colombia and Latin America. The *Paladin Agreement* expires on a country by country

Table of Contents

basis the later of fifteen years after the first commercial sale of the product in that country or expiration of market exclusivity for Zertane in that country. Paladin paid \$250,000 to Vyrix upon signing the Paladin Agreement. In addition, the Paladin Agreement provides that Paladin pays royalties based on sales volume. We may enter into additional licensing and collaboration arrangements, which may provide us with potential milestone payments and royalties and those arrangements, if obtained, will be our primary source of revenues for the coming years. We cannot be certain that any other licensing or collaboration arrangements will be concluded, or that the terms of those arrangements will result in our receiving material revenues. To obtain revenues from product candidates, we must succeed, either alone or with others, in a range of challenging activities, including completing clinical trials of our product candidates, obtaining marketing approval for these product candidates, manufacturing, marketing and selling those products for which we, or our collaborators, may obtain marketing approval, satisfying any post-marketing requirements and obtaining reimbursement for our products from private insurance or government payors. We, and our collaborators, may never succeed in these activities and, even if we do, or one of our collaborators does, we may never generate revenues that are significant enough to achieve profitability.

We will need substantial additional capital to fund our operations. If we are unable to raise capital when needed, we could be forced to delay, reduce or eliminate our product development programs and commercialization efforts.

Developing pharmaceutical products, including conducting pre-clinical studies and clinical trials, is a very time-consuming, expensive and uncertain process that takes years to complete. We expect our expenses to increase in connection with our ongoing activities, particularly as we initiate new clinical trials of, initiate new research and pre-clinical development efforts for and seek marketing approval for, our product candidates. We will require additional capital to fund our operations, including to:

continue to fund clinical trials of Ampion, Optina and Zertane;

prepare for and apply for regulatory approval for our product candidates;

further develop and assess the clinical utility of the oxidation reduction potential (ORP) diagnostic device, or the ORP device;

develop additional product candidates;

conduct additional clinical research and development;

pursue existing and new claims covered by intellectual property we own or license; and

sustain our corporate overhead requirements, and hire and retain necessary personnel.

Until we can generate revenue from collaboration agreements to finance our cash requirements, which we may not accomplish, we expect to finance future cash needs primarily through offerings of our equity securities or debt. We currently have only two collaboration agreement in effect, which relates to Zertane in South Korea, Canada, the

Republic of South Africa, certain countries in Sub Saharan Africa, Colombia and Latin America .

We do not know whether additional funding will be available to us on acceptable terms, or at all. If we are unable to secure additional funding when needed, we may have to delay, reduce the scope, or eliminate development of one or more of our product candidates, or substantially curtail or close our operations altogether. Alternatively, we may have to obtain a collaborator for one or more of our product candidates at an earlier stage of development, which could lower the economic value of those product candidates to us.

Ampion, Optina, Zertane and our ORP Device are currently undergoing, or are expected to undergo, clinical trials that are time-consuming and expensive, the outcomes of which are unpredictable, and for which there is a high risk of failure. If clinical trials of our product candidates fail to satisfactorily demonstrate safety and efficacy to the FDA and other regulators, we, or our collaborators, may incur additional costs or experience delays in completing, or ultimately be unable to complete, the development and commercialization of these product candidates.

Pre-clinical testing and clinical trials are long, expensive and unpredictable processes that can be subject to extensive delays. We cannot guarantee that any clinical studies will be conducted as planned or completed on schedule, if at all. It may take several years to complete the pre-clinical testing and clinical development necessary to commercialize a drug or biologic, and delays or failure can occur at any stage. Interim results of clinical trials do not necessarily predict final results, and success in pre-clinical testing and early clinical trials does not ensure that later clinical trials will be successful. A number of companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in advanced clinical trials even after promising results in earlier trials and we cannot be certain that we will not face similar setbacks. The design of a clinical trial can determine whether its results will support approval of a product and flaws in the design of a clinical trial may not become apparent until the clinical trial is well advanced.

Table of Contents

Our product development programs are at various stages of development. We continue to work toward completion and analysis of clinical trials for our primary products: Ampion, Optina and Zertane as well as for Zertane and the ORP device. An unfavorable outcome in one or more trials for Ampion, Optina or the ORP Device would be a major set-back for the development programs for these product candidates and for us. Due to our limited financial resources, an unfavorable outcome in one or more of these trials may require us to delay, reduce the scope of, or eliminate one of these product development programs, which could have a material adverse effect on our business and financial condition and on the value of our common stock.

In connection with clinical testing and trials, we face a number of risks, including:

a product candidate is ineffective, inferior to existing approved medicines, unacceptably toxic, or has unacceptable side effects;

patients may die or suffer other adverse effects for reasons that may or may not be related to the product candidate being tested;

the results may not confirm the positive results of earlier testing or trials; and

the results may not meet the level of statistical significance required by the U.S. Food and Drug Administration, or FDA, or other regulatory agencies to establish the safety and efficacy of our product candidates.

The results of pre-clinical studies do not necessarily predict clinical success, and larger and later-stage clinical studies may not produce the same results as earlier-stage clinical studies. Frequently, product candidates developed by pharmaceutical companies have shown promising results in early pre-clinical or clinical studies, but have subsequently suffered significant setbacks or failed in later clinical studies. In addition, clinical studies of potential products often reveal that it is not possible or practical to continue development efforts for these product candidates.

If we do not successfully complete pre-clinical and clinical development, we will be unable to market and sell products derived from our product candidates and generate revenues. Even if we do successfully complete clinical trials, those results are not necessarily predictive of results of additional trials that may be needed before an NDA or BLA may be submitted to the FDA. Although there are a large number of drugs and biologics in development in the U.S. and other countries, only a small percentage result in the submission of an NDA or BLA to the FDA, even fewer are approved for commercialization, and only a small number achieve widespread physician and consumer acceptance following regulatory approval. If our clinical studies are substantially delayed or fail to prove the safety and effectiveness of our product candidates in development, we may not receive regulatory approval of any of these product candidates and our business and financial condition will be materially harmed.

Delays, suspensions and terminations in our clinical trials could result in increased costs to us and delay or prevent our ability to generate revenues.

Human clinical trials are very expensive, time-consuming, and difficult to design, implement and complete. We currently expect clinical trials of our product candidates could take from six to 24 months to complete, but the completion of trials for our product candidates may be delayed for a variety of reasons, including delays in:

demonstrating sufficient safety and efficacy to obtain regulatory approval to commence a clinical trial;

reaching agreement on acceptable terms with prospective contract research organizations and clinical trial sites;

manufacturing sufficient quantities of a product candidate;

obtaining approval of an IND from the FDA;

obtaining institutional review board approval to conduct a clinical trial at a prospective clinical trial site;

determining dosing and making related adjustments; and

patient enrollment, which is a function of many factors, including the size of the patient population, the nature of the protocol, the proximity of patients to clinical trial sites, the availability of effective treatments for the relevant disease and the eligibility criteria for the clinical trial.

The commencement and completion of clinical studies for our product candidates may be delayed, suspended or terminated due to a number of factors, including:

lack of effectiveness of product candidates during clinical studies;

adverse events, safety issues or side effects relating to the product candidates or their formulation;

Table of Contents

inability to raise additional capital in sufficient amounts to continue clinical trials or development programs, which are very expensive;

the need to sequence clinical studies as opposed to conducting them concomitantly in order to conserve resources;

our inability to enter into collaborations relating to the development and commercialization of our product candidates;

failure by us or our collaborators to conduct clinical trials in accordance with regulatory requirements;

our inability or the inability of our collaborators to manufacture or obtain from third parties materials sufficient for use in pre-clinical and clinical studies;

governmental or regulatory delays and changes in regulatory requirements, policy and guidelines, including mandated changes in the scope or design of clinical trials or requests for supplemental information with respect to clinical trial results;

failure of our collaborators to advance our product candidates through clinical development;

delays in patient enrollment, variability in the number and types of patients available for clinical studies, and lower than anticipated retention rates for patients in clinical trials;

difficulty in patient monitoring and data collection due to failure of patients to maintain contact after treatment;

a regional disturbance where we or our collaborative partners are enrolling patients in our clinical trials, such as a pandemic, terrorist activities or war, or a natural disaster; and

varying interpretations of data by the FDA and similar foreign regulatory agencies.

Many of these factors may also ultimately lead to denial of regulatory approval of a current or potential product candidate. If we experience delay, suspensions or terminations in a clinical trial, the commercial prospects for the related product candidate will be harmed, and our ability to generate product revenues will be delayed. For example, in August 2014 we experienced a delay in the STEP Study of Ampion due to a deviation from protocol in temperature excursions in over 70% of the drug supply for the study. We cannot be certain we will successfully complete the Phase III Ampion and §505(b)(2) Optina trials within any specific time period, if at all.

In addition, we may encounter delays or product candidate rejections based on new governmental regulations, future legislative or administrative actions, or changes in FDA policy or interpretation during the period of product development. If we obtain required regulatory approvals, such approvals may later be withdrawn. Delays or failures in obtaining regulatory approvals may:

adversely affect the commercialization of any product candidates we develop;

diminish any competitive advantages that such product candidates may have or attain.

Furthermore, if we fail to comply with applicable FDA and other regulatory requirements at any stage during this regulatory process, we may encounter or be subject to:

delays in clinical trials or commercialization;

refusal by the FDA to review pending applications or supplements to approved applications;

product recalls or seizures;

suspension of manufacturing;

withdrawals of previously approved marketing applications; and

fines, civil penalties, and criminal prosecutions.

If we do not secure collaborations with strategic partners to test, commercialize and manufacture product candidates, we may not be able to successfully develop products and generate meaningful revenues.

A key aspect of our current strategy is to selectively enter into collaborations with third parties to conduct clinical testing, as well as to commercialize and manufacture product candidates. Our ability to generate revenues from these arrangements will depend on our collaborators' abilities to successfully perform the functions assigned to them in these arrangements. We currently have only two collaboration agreements in effect, which relate to Zertane in South Korea, Canada, the Republic of South Africa, certain countries in Sub-Saharan Africa, Colombia and Latin America. Collaboration agreements typically call for milestone payments that depend on successful demonstration of efficacy and safety, obtaining regulatory approvals, and clinical trial results. Collaboration revenues are not guaranteed, even when efficacy and safety are demonstrated. The current economic environment may result in potential collaborators electing to reduce their external spending, which may prevent us from developing our product candidates.

Table of Contents

Even if we succeed in securing collaborators, the collaborators may fail to develop or effectively commercialize products using our product candidates or technologies. Collaborations involving our product candidates pose a number of risks, including the following:

collaborators may not have sufficient resources or decide not to devote the necessary resources due to internal constraints such as budget limitations, lack of human resources, or a change in strategic focus;

collaborators may believe our intellectual property or the product candidate infringes on the intellectual property rights of others;

collaborators may dispute their responsibility to conduct development and commercialization activities pursuant to the applicable collaboration, including the payment of related costs or the division of any revenues;

collaborators may decide to pursue a competitive product developed outside of the collaboration arrangement;

collaborators may not be able to obtain, or believe they cannot obtain, the necessary regulatory approvals;

collaborators may delay the development or commercialization of our product candidates in favor of developing or commercializing another party's product candidate; or

collaborators may decide to terminate or not to renew the collaboration for these or other reasons.

Thus, collaboration agreements may not lead to development or commercialization of product candidates in the most efficient manner or at all. For example, our former collaborator that licensed Zertane conducted clinical trials which we believe demonstrated efficacy in treating PE, but the collaborator undertook a merger that we believe altered its strategic focus and thereafter terminated the collaboration agreement. The merger also created a potential conflict with a principal customer of the acquired company, which sells a product to treat PE in certain European markets.

Collaboration agreements are generally terminable without cause on short notice. Once a collaboration agreement is signed, it may not lead to commercialization of a product candidate. We also face competition in seeking out collaborators. If we are unable to secure new collaborations that achieve the collaborator's objectives and meet our expectations, we may be unable to advance our product candidates and may not generate meaningful revenues.

If our product candidates are not approved by the FDA, we will be unable to commercialize them in the United States.

The FDA must approve any new medicine before it can be commercialized, marketed, promoted or sold in the United States. We must provide the FDA with data from pre-clinical and clinical studies that demonstrate that our product candidates are safe and effective for a defined indication before they can be approved for commercial distribution.

Clinical testing is expensive, difficult to design and implement, can take many years to complete and is inherently uncertain as to outcome. We will not obtain approval for a product candidate unless and until the FDA approves a NDA for a drug and a BLA for a biologic. The processes by which regulatory approvals are obtained from the FDA to market and sell a new or repositioned product are complex, require a number of years and involve the expenditure of substantial resources. We cannot assure you that any of our product candidates will receive FDA approval in the future, and the time for receipt of any such approval is currently incapable of estimation.

We or our collaborators intend to seek FDA approval for most of our product candidates using an expedited process established by the FDA. If we, or our collaborators, are unable to secure clearances to use expedited development pathways from the FDA for certain of our drug product candidates, we, or they, may be required to conduct additional pre-clinical studies or clinical trials beyond those that we, or they, contemplate, which could increase the expense of obtaining, and delay the receipt of, necessary marketing approvals and of any product revenues.

Assuming successful completion of clinical trials, we expect to submit NDAs to the FDA at various times in the future under §505(b)(2) of the Food, Drug and Cosmetic Act, as amended, or the FDCA. NDAs submitted under this section are eligible to receive FDA approval by relying in part on the FDA's findings of safety and efficacy for a previously approved drug. We are currently pursuing in our clinical trials a §505(b)(2) pathway for Optina and may also do so for other product candidates. The FDA's 1999 guidance on §505(b)(2) applications states that new indications for a previously approved drug, a new combination product, a modified active ingredient, or changes in dosage form, strength, formulation, and route of administration of a previously approved product are encompassed within the §505(b)(2) NDA process. Relying on §505(b)(2) is advantageous because we or our collaborators may not be required (i) to perform the full range of safety and efficacy trials that is otherwise required to secure approval of a new drug, and (ii) obtain a right of reference from the applicant that obtained approval of the previously approved drug. However, a §505(b)(2) application must support the proposed change of the previously approved drug by including necessary and adequate information, as determined by the FDA, and the FDA may still require us to perform a full range of safety and efficacy trials.

If one of our product candidates achieves clinical trial objectives, we must prepare and submit to the FDA a comprehensive NDA or BLA application. Review of the application may lead the FDA to request more information or require us to perform additional clinical

Table of Contents

trials, thus adding to product development costs and delaying any marketing approval from the FDA. Additionally, time to review may vary significantly based on the disease to be treated, availability of alternate treatments, severity of the disease, and the risk/benefit profile of the proposed product. Even if one of our products receives FDA marketing approval, we could be required to conduct post-marketing Phase IV studies and surveillance to monitor for adverse effects. If we experience delays in NDA application processing, requests for additional information or further clinical trials, or are required to conduct post-marketing studies or surveillance, our product development costs could increase substantially, and our ability to generate revenues from a product candidate could be postponed, perhaps indefinitely. The resulting negative impact on our operating results and financial condition may cause the value of our common stock to decline, and you may lose all or a part of your investment.

The approval process outside the United States varies among countries and may limit our ability to develop, manufacture and sell our products internationally. Failure to obtain marketing approval in international jurisdictions would prevent our product candidates from being marketed abroad.

In order to market and sell our products in the European Union and many other jurisdictions, we, and our collaborators, must obtain separate marketing approvals and comply with numerous and varying regulatory requirements. The approval procedure varies among countries and can involve additional testing. We may conduct clinical trials for, and seek regulatory approval to market, our product candidates in countries other than the United States. Depending on the results of clinical trials and the process for obtaining regulatory approvals in other countries, we may decide to first seek regulatory approvals of a product candidate in countries other than the U.S., or we may simultaneously seek regulatory approvals in the U.S. and other countries. If we or our collaborators seek marketing approvals for a product candidate outside the U.S., we will be subject to the regulatory requirements of health authorities in each country in which we seek approvals. With respect to marketing authorizations in Europe, we will be required to submit a European marketing authorization application, or MAA, to the European Medicines Agency, or EMA, which conducts a validation and scientific approval process in evaluating a product for safety and efficacy. The approval procedure varies among regions and countries and can involve additional testing, and the time required to obtain approvals may differ from that required to obtain FDA approval. Obtaining regulatory approvals from health authorities in countries outside the U.S. is likely to subject us to all of the risks associated with obtaining FDA approval described above. In addition, marketing approval by the FDA does not ensure approval by the health authorities of any other country, and approval by foreign health authorities does not ensure marketing approval by the FDA.

Even if we, or our collaborators, obtain marketing approvals for our product candidates, the terms of approvals and ongoing regulation of our products may limit how we, or they, manufacture and market our products, which could materially impair our ability to generate revenue.

Even if we receive regulatory approval for a product candidate, this approval may carry conditions that limit the market for the product or put the product at a competitive disadvantage relative to alternative therapies. For instance, a regulatory approval may limit the indicated uses for which we can market a product or the patient population that may utilize the product, or may be required to carry a warning in its labeling and on its packaging. Products with boxed warnings are subject to more restrictive advertising regulations than products without such warnings. These restrictions could make it more difficult to market any product candidate effectively.

In addition, manufacturers of approved products and those manufacturers' facilities are required to comply with extensive FDA requirements, including ensuring that quality control and manufacturing procedures conform to cGMPs, which include requirements relating to quality control and quality assurance as well as the corresponding maintenance of records and documentation and reporting requirements. We, our contract manufacturers, our collaborators and their contract manufacturers could be subject to periodic unannounced inspections by the FDA to

monitor and ensure compliance with cGMPs.

Accordingly, assuming we, or our collaborators, receive marketing approval for one or more of our product candidates, we, and our collaborators, and our and their contract manufacturers will continue to expend time, money and effort in all areas of regulatory compliance, including manufacturing, production, product surveillance and quality control.

Any of our product candidates for which we, or our collaborators, obtain marketing approval in the future could be subject to post-marketing restrictions or withdrawal from the market and we, and our collaborators, may be subject to substantial penalties if we, or they, fail to comply with regulatory requirements or if we, or they, experience unanticipated problems with our products following approval.

Any of our product candidates for which we, or our collaborators, obtain marketing approval in the future, as well as the manufacturing processes, post-approval studies and measures, labeling, advertising and promotional activities for such products, among other things, will be subject to continual requirements of and review by the FDA and other regulatory authorities. These requirements include submissions of safety and other post-marketing information and reports, registration and listing requirements, requirements relating to manufacturing, quality control, quality assurance and corresponding maintenance of records and documents,

Table of Contents

requirements regarding the distribution of samples to physicians and recordkeeping. Even if marketing approval of a product candidate is granted, the approval may be subject to limitations on the indicated uses for which the product may be marketed or to the conditions of approval, including the FDA requirement to implement a Risk Evaluation and Mitigation Strategy (REMS) to ensure that the benefits of a drug or biological product outweigh its risks.

The FDA may also impose requirements for costly post-marketing studies or clinical trials and surveillance to monitor the safety or efficacy of a product. The FDA and other agencies, including the Department of Justice, closely regulate and monitor the post-approval marketing and promotion of products to ensure that they are manufactured, marketed and distributed only for the approved indications and in accordance with the provisions of the approved labeling. The FDA imposes stringent restrictions on manufacturers' communications regarding off-label use and if we, or our collaborators, do not market any of our product candidates for which we, or they, receive marketing approval for only their approved indications, we, or they, may be subject to warnings or enforcement action for off-label marketing. Violation of the FDCA, the Public Health Service Act (PHSA), and other statutes, including the False Claims Act, relating to the promotion and advertising of prescription drugs may lead to investigations or allegations of violations of federal and state health care fraud and abuse laws and state consumer protection laws.

If we do not achieve our projected development and commercialization goals in the timeframes we announce and expect, the commercialization of our product candidates may be delayed, our business will be harmed, and our stock price may decline.

We sometimes estimate for planning purposes the timing of the accomplishment of various scientific, clinical, regulatory and other product development objectives. These milestones may include our expectations regarding the commencement or completion of scientific studies, clinical trials, the submission of regulatory filings, or commercialization objectives. From time to time, we may publicly announce the expected timing of some of these milestones, such as the completion of an ongoing clinical trial, the initiation of other clinical programs, receipt of marketing approval, or a commercial launch of a product. The achievement of many of these milestones may be outside of our control. All of these milestones are based on a variety of assumptions which may cause the timing of achievement of the milestones to vary considerably from our estimates, including:

our available capital resources or capital constraints we experience;

the rate of progress, costs and results of our clinical trials and research and development activities, including the extent of scheduling conflicts with participating clinicians and collaborators, and our ability to identify and enroll patients who meet clinical trial eligibility criteria;

our receipt of approvals by the FDA and other regulatory agencies and the timing thereof;

other actions, decisions or rules issued by regulators;

our ability to access sufficient, reliable and affordable supplies of compounds used in the manufacture of our product candidates;

the efforts of our collaborators with respect to the commercialization of our products; and

the securing of, costs related to, and timing issues associated with, product manufacturing as well as sales and marketing activities.

If we fail to achieve announced milestones in the timeframes we announce and expect, our business and results of operations may be harmed and the price of our stock may decline.

Our success is dependent in large part upon the continued services of our Chief Scientific Officer.

Our success is dependent in large part upon the continued services of our Chief Scientific Officer, Dr. David Bar-Or. We have an employment agreement with Dr. Bar-Or and a research agreement with Trauma Research LLC, an entity owned by Dr. Bar-Or that conducts research and development activities on our behalf. These agreements are terminable on short notice for cause by us or Dr. Bar-Or and may also be terminated without cause under certain circumstances. We do not maintain key-man life insurance on Dr. Bar-Or, although we may elect to obtain such coverage in the future. If we lost the services of Dr. Bar-Or for any reason, our clinical testing and other product development activities may experience significant delays, and our ability to develop and commercialize new product candidates may be diminished.

If we do not obtain the capital necessary to fund our operations, we will be unable to successfully develop, obtain regulatory approval of, and commercialize, pharmaceutical products.

The development of pharmaceutical products is capital-intensive. At December 31, 2014, we had cash and cash equivalents of approximately \$50.3 million. Based upon our current plans, it may be necessary to raise additional capital within the next 18 months. We have not received, and without any form of additional capital financing or revenues do not expect to receive for several years, any

Table of Contents

revenues from the commercialization of our product candidates. In 2014, 2013 and 2012, we obtained a total of approximately \$63.4 million, \$28.9 million and \$15.4 million, respectively, in net proceeds from the sale of our common stock in an underwritten public offering, a registered direct offering and another underwritten public offering, respectively. We anticipate we will require significant additional financing to continue to fund our operations beyond the next 18 months. Our future capital requirements will depend on, and could increase significantly as a result of, many factors including:

progress in, and the costs of, our pre-clinical studies and clinical trials and other research and development programs;

the scope, prioritization and number of our research and development programs;

the achievement of milestones or occurrence of other developments that trigger payments under any collaboration agreements we obtain;

the extent to which we are obligated to reimburse, or entitled to reimbursement of, clinical trial costs under future collaboration agreements, if any;

the costs involved in filing, prosecuting, enforcing and defending patent claims and other intellectual property rights;

the costs of securing manufacturing arrangements for commercial production; and

the costs of establishing or contracting for sales and marketing capabilities if we obtain regulatory clearances to market our product candidates.

Until we can generate significant continuing revenues, we expect to satisfy our future cash needs through collaboration arrangements, private or public sales of our securities, debt financings, or by licensing one or more of our product candidates. Dislocations in the financial markets have generally made equity and debt financing more difficult to obtain, and may have a material adverse effect on our ability to meet our fundraising needs. We cannot be certain that additional funding will be available to us on acceptable terms, if at all. If funds are not available, we may be required to delay, reduce the scope of, or eliminate one or more of our research or development programs or our commercialization efforts. Additional funding, if obtained, may significantly dilute existing shareholders if that financing is obtained through issuing equity or instruments convertible into equity.

We rely on third parties to conduct our clinical trials and perform data collection and analysis, which may result in costs and delays that prevent us from successfully commercializing product candidates.

Although we design and manage our current pre-clinical studies, we do not have the in-house capability to conduct clinical trials for our product candidates. We rely, and will rely in the future, on medical institutions, clinical investigators, contract research organizations, contract laboratories, and collaborators to perform data collection and

analysis and other aspects of our clinical trials. We rely primarily on Trauma Research LLC, a related party, to conduct pre-clinical studies and provide assessments of clinical observations.

Our pre-clinical activities or clinical trials conducted in reliance on third parties may be delayed, suspended, or terminated if:

the third parties do not successfully carry out their contractual duties or fail to meet regulatory obligations or expected deadlines;

we replace a third party; or

the quality or accuracy of the data obtained by third parties is compromised due to their failure to adhere to clinical protocols, regulatory requirements, or for other reasons.

Third party performance failures may increase our development costs, delay our ability to obtain regulatory approval, and delay or prevent the commercialization of our product candidates. While we believe that there are numerous alternative sources to provide these services, in the event that we seek such alternative sources, we may not be able to enter into replacement arrangements without incurring delays or additional costs.

Even if collaborators with which we contract in the future successfully complete clinical trials of our product candidates, those candidates may not be commercialized successfully for other reasons.

Even if we contract with collaborators that successfully complete clinical trials for one or more of our product candidates, those candidates may not be commercialized for other reasons, including:

failure to receive regulatory clearances required to market them as drugs;

being subject to proprietary rights held by others;

being difficult or expensive to manufacture on a commercial scale;

having adverse side effects that make their use less desirable; or

failing to compete effectively with products or treatments commercialized by competitors.

Relying on third-party manufacturers may result in delays in our clinical trials and product introductions.

Table of Contents

Our core business strategy is to maintain a strong foundation in basic scientific research and combine that foundation with our clinical development capabilities. To date, we have contracted original equipment manufacturers (OEMs) to produce the biologic for our Ampion clinical trials and the drug candidate for our Optina clinical trials. Our long-term objective is to build a successful, integrated biopharmaceutical company that provides patients and medical professionals with new and better options for preventing and treating human diseases. However, developing and commercializing new medicines entails significant risks and expenses. We have little experience in the manufacturing of drugs or in designing drug-manufacturing processes. We currently obtain the HSA need to produce Ampion for our clinical trials from one manufacturer in the United States. Our clinical trials may be delayed if this manufacturer is unable to assure a sufficient quantity of the drug product to meet our study needs. We are currently validating a manufacturing facility in Denver, Colorado where we plan to manufacture Ampion for registration, batching and commercial supply, as well as future clinical supplies. If we experience delays or difficulties in this effort, including the FDA requiring us to conduct a comparability study evaluating the product that we used for clinical studies involving Ampion with the product that we intend to market in the United States, which will be manufactured at our facility in the Denver metropolitan area, our clinical trials may be impacted, our commercialization efforts may be impeded, or our costs may increase. We obtain the active pharmaceutical ingredient (API) for Optina from an Indian company, which is one of only four suppliers of the API in the world. Our clinical trials and ultimately FDA approval may be delayed if we are unable to obtain a sufficient quantity of the drug product on a timely basis or if we need to establish an alternative source of supply for the API.

Once regulatory approval is obtained, a marketed product and its manufacturer are subject to continual review. The discovery of previously unknown problems with a product or manufacturer may result in restrictions on the product, manufacturer or manufacturing facility, including withdrawal of the product from the market. Any manufacturers with which we contract HSA for Ampion or danazol for Optina supplies are required to operate in accordance with FDA-mandated current good manufacturing practices, or cGMPs. A failure of any of our contract manufacturers to establish and follow cGMPs and to document their adherence to such practices may lead to significant delays in the launch of products based on our product candidates into the market. Failure by third-party manufacturers to comply with applicable regulations could result in sanctions being imposed on us, including fines, injunctions, civil penalties, revocation or suspension of marketing approval for any products granted pre-market approvals, seizures or recalls of products, operating restrictions, and criminal prosecutions.

Our transactions with related parties may not benefit us and may harm us.

We are party to a sponsored research agreement with Trauma Research LLC, a related party controlled by our director and Chief Scientific Officer, Dr. Bar-Or. We rely primarily on Trauma Research LLC to conduct pre-clinical studies and provide assessments of clinical observations. In addition, Luoxis is party to an agreement with Trauma Research LLC, under which Luoxis pays Trauma Research LLC for services related to research and development of Luoxis Oxidation-Reduction Potential platform.

We believe that we have conducted our related-party transactions on an arm's-length basis and on terms comparable to, or more favorable to us than, similar transactions we would enter into with independent third parties. However, we cannot assure you that all our future transactions with related parties will be beneficial to us.

We intend to enter into agreements with third parties to sell and market any products we develop and for which we obtain regulatory approvals, which may affect the sales of our products and our ability to generate revenues.

We do not currently maintain an organization for the sale, marketing and distribution of pharmaceutical products and may contract with, or license, third parties to market any products we develop that receive regulatory approvals. Outsourcing sales and marketing in this manner may subject us to a variety of risks, including:

our inability to exercise control over sales and marketing activities and personnel;

failure or inability of contracted sales personnel to obtain access to or persuade adequate numbers of physicians to prescribe our products;

disputes with third parties concerning sales and marketing expenses, calculation of royalties, and sales and marketing strategies; and

unforeseen costs and expenses associated with sales and marketing.

If we are unable to partner with a third party that has adequate sales, marketing, and distribution capabilities, we may have difficulty commercializing our product candidates, which would adversely affect our business, financial condition, and ability to generate product revenues.

We face substantial competition from companies with considerably more resources and experience than we have, which may result in others discovering, developing, receiving approval for, or commercializing products before or more successfully than us.

Table of Contents

Our ability to succeed in the future depends on our ability to discover, develop and commercialize pharmaceutical products that offer superior efficacy, convenience, tolerability, and safety when compared to existing treatment methodologies. We intend to do so by identifying product candidates that address new indications using previously approved drugs, use of new combinations of previously approved drugs, or which are based on a modified active ingredient which previously received regulatory approval. Because our strategy is to develop new product candidates primarily for treatment of diseases that affect large patient populations, those candidates are likely to compete with a number of existing medicines or treatments, and a large number of product candidates that are being developed by others.

Many of our potential competitors have substantially greater financial, technical, personnel and marketing resources than we do. In addition, many of these competitors have significantly greater resources devoted to product development and pre-clinical research. Our ability to compete successfully will depend largely on our ability to:

discover and develop product candidates that are superior to other products in the market;

attract and retain qualified personnel;

obtain patent and/or other proprietary protection for our product candidates;

obtain required regulatory approvals; and

obtain collaboration arrangements to commercialize our product candidates.

Established pharmaceutical companies devote significant financial resources to discovering, developing or licensing novel compounds that could make our product candidates obsolete. Our competitors may obtain patent protection, receive FDA approval, and commercialize medicines before us. Other companies are engaged in the discovery of compounds that may compete with the product candidates we are developing.

Any new product that competes with a currently-approved treatment or medicine must demonstrate compelling advantages in efficacy, convenience, tolerability and/or safety in order to address price competition and be commercially successful. If we are not able to compete effectively against our current and future competitors, our business will not grow and our financial condition and operations will suffer.

Product liability and other lawsuits could divert our resources, result in substantial liabilities and reduce the commercial potential of our product candidates.

The risk that we may be sued on product liability claims is inherent in the development and commercialization of pharmaceutical products. Side effects of, or manufacturing defects in, products that we develop which are commercialized by any collaborators could result in the deterioration of a patient's condition, injury or even death. Once a product is approved for sale and commercialized, the likelihood of product liability lawsuits increases. Claims may be brought by individuals seeking relief for themselves or by individuals or groups seeking to represent a class. These lawsuits may divert our management from pursuing our business strategy and may be costly to defend. In addition, if we are held liable in any of these lawsuits, we may incur substantial liabilities and may be forced to limit

or forgo further commercialization of the affected products.

We may be subject to legal or administrative proceedings and litigation other than product liability lawsuits which may be costly to defend and could materially harm our business, financial conditions and operations.

Although we maintain general liability and product liability insurance, this insurance may not fully cover potential liabilities. In addition, inability to obtain or maintain sufficient insurance coverage at an acceptable cost or to otherwise protect against potential product or other legal or administrative liability claims could prevent or inhibit the commercial production and sale of any of our product candidates that receive regulatory approval, which could adversely affect our business. Product liability claims could also harm our reputation, which may adversely affect our collaborators' ability to commercialize our products successfully.

If any of our product candidates are commercialized, this does not assure acceptance by physicians, patients, third party payors, or the medical community in general. Even if we, or our collaborators, are able to commercialize our product candidates, the products may become subject to unfavorable pricing regulations, third party payor reimbursement practices or healthcare reform initiatives that could harm our business.

The commercial success of our product candidates will depend substantially, both domestically and abroad, on the extent to which the costs of our product candidates will be paid by health maintenance, managed care, pharmacy benefit and similar healthcare management organizations, or reimbursed by government health administration authorities, private health coverage insurers and other third party payors. If reimbursement is not available, or is available only to limited levels, we, or our collaborators, may not be able to successfully commercialize our product candidates. Even if coverage is provided, the approved reimbursement amount may not be

Table of Contents

high enough to allow us, or our collaborators, to establish or maintain pricing sufficient to realize a sufficient return on our or their investments. We cannot be sure that any of our product candidates, if and when approved for marketing, will be accepted by these parties. Even if the medical community accepts a product as safe and efficacious for its indicated use, physicians may choose to restrict the use of the product if we or any collaborator is unable to demonstrate that, based on experience, clinical data, side-effect profiles and other factors, our product is preferable to any existing medicines or treatments. We cannot predict the degree of market acceptance of any product candidate that receives marketing approval, which will depend on a number of factors, including, but not limited to:

the demonstration of the clinical efficacy and safety of the product;

the approved labeling for the product and any required warnings;

the advantages and disadvantages of the product compared to alternative treatments;

our and any collaborator's ability to educate the medical community about the safety and effectiveness of the product;

the reimbursement policies of government and third party payors pertaining to the product; and

the market price of our product relative to competing treatments.

Government restrictions on pricing and reimbursement, as well as other healthcare payor cost-containment initiatives, may negatively impact our ability to generate revenues if we obtain regulatory approval to market a product.

The continuing efforts of the government, insurance companies, managed care organizations and other payors of health care costs to contain or reduce costs of health care may adversely affect one or more of the following:

our or our collaborators' ability to set a price we believe is fair for our products, if approved;

our ability to generate revenues and achieve profitability; and

the availability of capital.

The 2010 enactments of the Patient Protection and Affordable Care Act, or PPACA, and the Health Care and Education Reconciliation Act are expected to significantly impact the provision of, and payment for, health care in the United States. Various provisions of these laws take effect over the next four years, and are designed to expand Medicaid eligibility, subsidize insurance premiums, provide incentives for businesses to provide health care benefits, prohibit denials of coverage due to pre-existing conditions, establish health insurance exchanges, and provide

additional support for medical research. Additional legislative proposals to reform healthcare and government insurance programs, along with the trend toward managed healthcare in the United States, could influence the purchase of medicines and reduce demand and prices for our products, if approved. This could harm our or our collaborators' ability to market any products and generate revenues. Cost containment measures that health care payors and providers are instituting and the effect of further health care reform could significantly reduce potential revenues from the sale of any of our product candidates approved in the future, and could cause an increase in our compliance, manufacturing, or other operating expenses. In addition, in certain foreign markets, the pricing of prescription drugs is subject to government control and reimbursement may in some cases be unavailable. We believe that pricing pressures at the federal and state level, as well as internationally, will continue and may increase, which may make it difficult for us to sell our potential products that may be approved in the future at a price acceptable to us or any of our future collaborators.

If Trauma Research LLC uses hazardous and biological materials in a manner that causes injury or violates applicable law, we may be liable for damages or fines.

The research and development activities conducted on our behalf by Trauma Research LLC, a related party controlled by Dr. Bar-Or, involve the controlled use of potentially hazardous substances, including chemical, biological and radioactive materials. In addition, Trauma Research LLC's operations produce hazardous waste products. Federal, state and local laws and regulations govern the use, manufacture, storage, handling and disposal of hazardous materials. If Trauma Research LLC experiences a release of hazardous substances, it is possible that this release could cause personal injury or death, and require decontamination of facilities. Trauma Research LLC has advised us that it believes it is in compliance with laws applicable to the handling of hazardous substances, but such compliance does not assure that a release of hazardous substances will not occur, or assure that such compliance will be maintained in the future. In the event of an accident involving research being conducted on our behalf, Trauma Research LLC could be held liable for damages or face substantial penalties for which we could also be responsible. We do not have any insurance for liabilities arising from the procurement, handling, or discharge of hazardous materials. Compliance with applicable environmental laws and regulations is expensive, and current or future environmental regulations may impair our research, development and production efforts, which could harm our business.

Table of Contents

Business interruptions could limit our ability to operate our business.

Our operations are vulnerable to damage or interruption from computer viruses, human error, natural disasters, telecommunications failures, intentional acts of misappropriation, and similar events. We have not established a formal disaster recovery plan, and our back-up operations and our business interruption insurance may not be adequate to compensate us for losses that occur. A significant business interruption could result in losses or damages incurred by us and require us to curtail our operations.

Risks Related to Our Intellectual Property

Our ability to compete may decline if we do not adequately protect our proprietary rights.

Our commercial success depends on obtaining and maintaining proprietary rights to our product candidates and compounds and their uses, as well as successfully defending these rights against third-party challenges. We will only be able to protect our product candidates, proprietary compounds, and their uses from unauthorized use by third parties to the extent that valid and enforceable patents, or effectively protected trade secrets, cover them.

Our ability to obtain patent protection for our product candidates and compounds is uncertain due to a number of factors, including:

we may not have been the first to make the inventions covered by pending patent applications or issued patents;

we may not have been the first to file patent applications for our product candidates or the compounds we developed or for their uses;

others may independently develop identical, similar or alternative products or compounds;

our disclosures in patent applications may not be sufficient to meet the statutory requirements for patentability;

any or all of our pending patent applications may not result in issued patents;

we may not seek or obtain patent protection in countries that may eventually provide us a significant business opportunity;

any patents issued to us may not provide a basis for commercially viable products, may not provide any competitive advantages, or may be successfully challenged by third parties;

our proprietary compounds may not be patentable;

others may design around our patent claims to produce competitive products which fall outside of the scope of our patents; or

others may identify prior art which could invalidate our patents.

Even if we have or obtain patents covering our product candidates or compounds, we may still be barred from making, using and selling our product candidates or technologies because of the patent rights of others. Others have or may have filed, and in the future may file, patent applications covering compounds or products that are similar or identical to ours. There are many issued U.S. and foreign patents relating to chemical compounds and therapeutic products, and some of these relate to compounds we intend to commercialize. Numerous U.S. and foreign issued patents and pending patent applications owned by others exist in the area of metabolic disorders, cancer, inflammatory responses, and the other fields in which we are developing products. These could materially affect our ability to develop our product candidates or sell our products if approved. Because patent applications can take many years to issue, there may be currently pending applications unknown to us that may later result in issued patents that our product candidates or compounds may infringe. These patent applications may have priority over patent applications filed by us.

We periodically conduct searches to identify patents or patent applications that may prevent us from obtaining patent protection for our compounds or that could limit the rights we have claimed in our patents and patent applications. Disputes may arise regarding the source or ownership of our inventions. It is difficult to determine if and how such disputes would be resolved. Others may challenge the validity of our patents. If our patents are found to be invalid, we will lose the ability to exclude others from making, using or selling the compounds or products addressed in those patents. In addition, compounds or products we may license may become important to some aspects of our business. We generally will not control the prosecution, maintenance or enforcement of patents covering licensed compounds or products.

Confidentiality agreements with employees and others may not adequately prevent disclosure of our trade secrets and other proprietary information and may not adequately protect our intellectual property, which could limit our ability to compete.

Because we operate in the highly technical field of drug discovery and development of therapies that can address metabolic disorders, cancer, inflammation and other conditions, we rely in part on trade secret protection in order to protect our proprietary technology and processes. However, trade secrets are difficult to protect. We enter into confidentiality and intellectual property assignment agreements with our employees, consultants, outside scientific collaborators, sponsored researchers, and other advisors. These agreements generally require that the other party keep confidential and not disclose to third parties all confidential information developed by the party or made known to the party by us during the course of the party's relationship with us. These agreements also generally provide that inventions conceived by the party in the course of rendering services to us will be our exclusive property.

Table of Contents

However, these agreements may not be honored and may not effectively assign intellectual property rights to us. Enforcing a claim that a party illegally obtained and is using our trade secrets is difficult, expensive and time consuming and the outcome is unpredictable. In addition, courts outside the United States may be less willing to protect trade secrets. The failure to obtain or maintain trade secret protection could adversely affect our competitive position. We have entered into non-compete agreements with certain of our employees, but the enforceability of those agreements is not assured.

A dispute concerning the infringement or misappropriation of our proprietary rights or the proprietary rights of others could be time consuming and costly, and an unfavorable outcome could harm our business.

There is significant litigation in the pharmaceutical industry regarding patent and other intellectual property rights. While we are not currently subject to any pending intellectual property litigation, and are not aware of any such threatened litigation, we may be exposed to future litigation by third parties based on claims that our product candidates, technologies or activities infringe the intellectual property rights of others. In particular, there are many patents relating to repositioned drugs and chemical compounds used to treat metabolic disorders, cancer and inflammation. Some of these may encompass repositioned drugs or compounds that we utilize in our product candidates. If our development activities are found to infringe any such patents, we may have to pay significant damages or seek licenses to such patents. A patentee could prevent us from using the patented drugs or compounds. We may need to resort to litigation to enforce a patent issued to us, to protect our trade secrets, or to determine the scope and validity of third-party proprietary rights. From time to time, we may hire scientific personnel or consultants formerly employed by other companies involved in one or more areas similar to the activities conducted by us. Either we or these individuals may be subject to allegations of trade secret misappropriation or other similar claims as a result of prior affiliations. If we become involved in litigation, it could consume a substantial portion of our managerial and financial resources, regardless of whether we win or lose. We may not be able to afford the costs of litigation. Any legal action against us or our collaborators could lead to:

payment of damages, potentially treble damages, if we are found to have willfully infringed a party's patent rights;

injunctive or other equitable relief that may effectively block our ability to further develop, commercialize, and sell products; or

us or our collaborators having to enter into license arrangements that may not be available on commercially acceptable terms, if at all.

As a result, we could be prevented from commercializing current or future product candidates.

Pharmaceutical patents and patent applications involve highly complex legal and factual questions, which, if determined adversely to us, could negatively impact our patent position.

The patent positions of pharmaceutical companies can be highly uncertain and involve complex legal and factual questions. For example, some of our patents and patent applications cover methods of use of repositioned drugs, while other patents and patent applications cover composition of a particular compound. The interpretation and breadth of claims allowed in some patents covering pharmaceutical compounds may be uncertain and difficult to determine, and are often affected materially by the facts and circumstances that pertain to the patented compound and the related

patent claims. The standards of the United States Patent and Trademark Office, or USPTO, are sometimes uncertain and could change in the future. Consequently, the issuance and scope of patents cannot be predicted with certainty. Patents, if issued, may be challenged, invalidated or circumvented. U.S. patents and patent applications may also be subject to interference proceedings, and U.S. patents may be subject to reexamination proceedings in the USPTO. Foreign patents may be subject also to opposition or comparable proceedings in the corresponding foreign patent office, which could result in either loss of the patent or denial of the patent application or loss or reduction in the scope of one or more of the claims of the patent or patent application. In addition, such interference, reexamination and opposition proceedings may be costly. Accordingly, rights under any issued patents may not provide us with sufficient protection against competitive products or processes.

In addition, changes in or different interpretations of patent laws in the United States and foreign countries may permit others to use our discoveries or to develop and commercialize our technology and products without providing any compensation to us, or may limit the number of patents or claims we can obtain. The laws of some countries do not protect intellectual property rights to the same extent as U.S. laws and those countries may lack adequate rules and procedures for defending our intellectual property rights. For example, some countries do not grant patent claims directed to methods of treating humans and, in these countries, patent protection may not be available at all to protect our product candidates. In addition, U.S. patent laws may change, which could prevent or limit us from filing patent applications or patent claims to protect our products and/or compounds.

If we fail to obtain and maintain patent protection and trade secret protection of our product candidates, proprietary compounds and their uses, we could lose our competitive advantage and competition we face would increase, reducing any potential revenues and adversely affecting our ability to attain or maintain profitability.

Table of Contents

Risks Related to Our Common Stock

The price of our stock has been extremely volatile and may continue to be volatile and fluctuate substantially, which could result in substantial losses for purchasers of our common stock.

The price of our common stock has been extremely volatile and may continue to be so. The stock market in general and the market for pharmaceutical companies in particular have experienced extreme volatility that has often been unrelated to the operating performance of particular companies, to a greater extent during the last few years. The following factors, in addition to the other risk factors described in this section, may also have a significant impact on the market price of our common stock:

any actual or perceived adverse developments in clinical trials for Ampion, Optina, Zertane or the ORP device, such as the delay experienced with the STEP Study of Ampion in August 2014;

any actual or perceived difficulties or delays in obtaining regulatory approval of any of our product candidates in the United States or other countries once clinical trials are completed;

any finding that our product candidates are not safe or effective, or any inability to demonstrate clinical effectiveness of our product candidates when compared to existing treatments;

any actual or perceived adverse developments in repurposed drug technologies, including any change in FDA policy or guidance on approval of repurposed drug technologies for new indications;

any announcements of developments with, or comments by, the FDA, the EMA, or other regulatory authorities with respect to product candidates we have under development;

any announcements concerning our retention or loss of key employees, especially Dr. Bar-Or;

our success or inability to obtain collaborators to conduct clinical trials, commercialize a product candidate for which regulatory approval is obtained, or market and sell an approved product candidate;

any actual or perceived adverse developments with respect to our relationship with Trauma Research LLC;

any licensee's termination of a license, such as that experienced with Zertane in 2010;

announcements of patent issuances or denials, product innovations, or introduction of new commercial products by our competitors that will compete with any of our product candidates;

publicity regarding actual or potential study results or the outcome of regulatory reviews relating to products under development by us, our collaborators, or our competitors;

economic and other external factors beyond our control; and

sales of stock by us or by our shareholders.

In addition, we believe there has been and may continue to be substantial off-market transactions in derivatives of our stock, including short selling activity or related similar activities, which are beyond our control and which may be beyond the full control of the SEC and Financial Institutions Regulatory Authority (FINRA). While SEC and FINRA rules prohibit some forms of short selling and other activities that may result in stock price manipulation, such activity may nonetheless occur without detection or enforcement. We have held conversations with regulators concerning trading activity in our stock; however, there can be no assurance that should there be any illegal manipulation in the trading of our stock it will be detected, prosecuted or successfully eradicated. Significant short selling or other types of market manipulation could cause our stock trading price to decline, to become more volatile, or both.

The price of our stock may be vulnerable to manipulation.

In late 2011 and the fall of 2014, our common stock was the subject of significant short selling efforts by certain market participants. Short sales are transactions in which a market participant sells a security that it does not own. To complete the transaction, the market participant must borrow the security to make delivery to the buyer. The market participant is then obligated to replace the security borrowed by purchasing the security at the market price at the time of required replacement. If the price at the time of replacement is lower than the price at which the security was originally sold by the market participant, then the market participant will realize a gain on the transaction. Thus, it is in the market participant's interest for the market price of the underlying security to decline as much as possible during the period prior to the time of replacement.

Because our unrestricted public float (not subject to lockup restrictions) has been small relative to other issuers, previous short selling efforts have impacted, and may in the future continue to impact, the value of our stock in an extreme and volatile manner to our detriment and the detriment of our shareholders. In addition, market participants with admitted short positions in our stock have published, and may in the future continue to publish, negative information regarding us and our management team on internet sites or

Table of Contents

blogs that we believe is inaccurate and misleading. We believe that the publication of this negative information has led, and may in the future continue to lead, to significant downward pressure on the price of our stock to our detriment and the further detriment of our shareholders. These and other efforts by certain market participants to manipulate the price of our common stock for their personal financial gain may cause our stockholders to lose a portion of their investment, may make it more difficult for us to raise equity capital when needed without significantly diluting existing stockholders, and may reduce demand from new investors to purchase shares of our stock.

If we cannot continue to satisfy the NYSE MKT listing maintenance requirements and other rules, including the director independence requirements, our securities may be delisted, which could negatively impact the price of our securities.

Although our common stock is listed on the NYSE MKT, we may be unable to continue to satisfy the listing maintenance requirements and rules. If we are unable to satisfy the NYSE MKT criteria for maintaining our listing, our securities could be subject to delisting. To qualify for continued listing on the NYSE MKT, we must continue to meet specific criteria, including the following:

The minimum bid price of our shares must be at least \$3.00, the market value of our publicly held shares must be at least \$15,000,000, our stockholders' equity must be at least \$4,000,000, and we must have at least (i) 800 public shareholders and 500,000 publicly held shares, or; (ii) 400 public shareholders and 1,000,000 publicly held shares; or

The minimum bid price of our shares must be at least \$2.00, the market value of our publicly held shares must be at least \$15,000,000, our stockholders' equity must be at least \$4,000,000, our market capitalization must exceed \$50,000,000, and we must have at least (i) 800 public shareholders and 500,000 publicly held shares, or; (ii) 400 public shareholders and 1,000,000 publicly held shares; or

The minimum bid price of our shares must be at least \$3.00, the market value of our publicly held shares must be at least \$20,000,000, our market capitalization must exceed \$75,000,000 or our assets and revenue must exceed \$75,000,000, and we must have at least (i) 800 public shareholders and 500,000 publicly held shares, or; (ii) 400 public shareholders and 1,000,000 publicly held shares.

Under the NYSE MKT rules, shares that are held by public shareholders do not include shares held by officers, directors, controlling shareholders and concentrated (10% or greater), affiliated or family holdings.

If the NYSE MKT delists our securities, we could face significant consequences, including:

a limited availability for market quotations for our securities;

reduced liquidity with respect to our securities;

a determination that our common stock is a penny stock, which will require brokers trading in our common stock to adhere to more stringent rules and possibly result in reduced trading;

activity in the secondary trading market for our common stock;

limited amount of news and analyst coverage; and

a decreased ability to issue additional securities or obtain additional financing in the future.

In addition, we would no longer be subject to the NYSE MKT rules, including rules requiring us to have a certain number of independent directors and to meet other corporate governance standards.

Concentration of our ownership limits the ability of our shareholders to influence corporate matters.

As of December 31, 2014, our directors, executive officers and their affiliates beneficially owned approximately 11.37% of our outstanding common stock. These shareholders may control effectively the outcome of actions taken by us that require shareholder approval.

Anti-takeover provisions in our charter and bylaws and in Delaware law could prevent or delay a change in control of Ampio.

Provisions of our certificate of incorporation and bylaws may discourage, delay or prevent a merger or acquisition that shareholders may consider favorable, including transactions in which shareholders might otherwise receive a premium for their shares. These provisions include:

requiring supermajority shareholder voting to effect certain amendments to our certificate of incorporation and bylaws;

restricting the ability of shareholders to call special meetings of shareholders;

Table of Contents

prohibiting shareholder action by written consent except in certain circumstances; and

establishing advance notice requirements for nominations for election to the board of directors or for proposing matters that can be acted on by shareholders at shareholder meetings.

Increased costs associated with corporate governance compliance may significantly impact our results of operations.

Changing laws, regulations and standards relating to corporate governance, public disclosure and compliance practices, including the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, the Sarbanes-Oxley Act of 2002, and new SEC regulations, may create difficulties for companies such as ours in understanding and complying with these laws and regulations. As a result of these difficulties and other factors, devoting the necessary resources to comply with evolving corporate governance and public disclosure standards has resulted in and may in the future result in increased general and administrative expenses and a diversion of management time and attention to compliance activities. We also expect these developments to increase our legal compliance and financial reporting costs. In addition, these developments may make it more difficult and more expensive for us to obtain director and officer liability insurance, and we may be required to accept reduced coverage or incur substantially higher costs to obtain coverage. Moreover, we may be unable to comply with these new laws and regulations on a timely basis.

These developments could make it more difficult for us to retain qualified members of our Board of Directors, or qualified executive officers. We are presently evaluating and monitoring regulatory developments and cannot estimate the timing or magnitude of additional costs we may incur as a result. To the extent these costs are significant; our general and administrative expenses are likely to increase.

If securities analysts do not publish research or reports about our business or if they downgrade our stock after instituting coverage, the price of our common stock could decline.

The research and reports that industry or financial analysts publish about us or our business may vary widely and may not predict accurate results, but will likely have an effect on the trading price of our common stock. If an industry analyst decides not to cover us, or if an industry analyst institutes coverage and later decides to cease covering us, we could lose visibility in the market, which in turn could cause our stock price to decline. If an industry analyst who covers our stock decides to downgrade that stock, our stock price would likely decline rapidly in response.

We have no plans to pay cash dividends on our common stock.

We have no plans to pay cash dividends on our common stock. We generally intend to invest future earnings, if any, to fund our growth. Any payment of future dividends will be at the discretion of our Board of Directors and will depend on, among other things, our earnings, financial condition, capital requirements, level of indebtedness, statutory and contractual restrictions applying to the payment of dividends and other considerations our Board of Directors deem relevant. Any future credit facilities or preferred stock financing we obtain may further limit our ability to pay cash dividends on our common stock.

Item 1B. *Unresolved Staff Comments*

None.

Item 2. *Properties*

We maintain our headquarters in leased space in Englewood, Colorado, for monthly rental payments of approximately \$26,250. The lease expires in September 2024. We anticipate that the lease can be renewed on terms similar to those now in effect.

Item 3. *Legal Proceedings*

We are currently not party to any material legal or administrative proceedings and are not aware of any material pending or threatened legal or administrative proceedings in which we will become involved.

Item 4. *Mine Safety Disclosures.*

Not applicable.

Table of Contents**PART II****Item 5. *Market for Registrant's Common Equity, Related Stockholder Matters and Issuer Purchases of Equity Securities*****Market Data**

On June 17, 2013, our common stock began trading on the NYSE MKT under the ticker symbol **AMPE**. It was previously quoted on the NASDAQ Capital Market under the same ticker symbol **AMPE**. Before it was listed on the NASDAQ Capital Market exchange, it was previously quoted on the Over-the-Counter Bulletin Board under the symbol **AMPE.OB**. The following table sets forth the high and low last reported sale price information for our common stock for each quarter for the past two fiscal years.

Fiscal Year ended December 31, 2014	High	Low
First Quarter	\$ 9.73	\$ 5.70
Second Quarter	\$ 8.35	\$ 5.44
Third Quarter	\$ 8.59	\$ 3.33
Fourth Quarter	\$ 4.16	\$ 3.25
Fiscal Year ended December 31, 2013	High	Low
First Quarter	\$ 4.89	\$ 3.65
Second Quarter	\$ 6.72	\$ 4.63
Third Quarter	\$ 7.79	\$ 5.27
Fourth Quarter	\$ 10.55	\$ 6.62

As of February 4, 2015, there were of record approximately 9,100 holders of our common stock.

We have never paid cash dividends and intend to employ all available funds in the development of our business. We have no plans to pay cash dividends in the near future. If we issue in the future any preferred stock or obtain financing from a bank, the terms of those financings may contain restrictions on our ability to pay dividends for so long as the preferred stock or bank financing is outstanding.

Table of Contents**Performance Graph**

We have presented below the cumulative return to our stockholders during the period from March 31, 2010, the date our stock began trading, through December 31, 2014 in comparison to the cumulative return NASDAQ Biotechnology Index and the Russell 2000 Index. The comparisons are based on historical data and are not indicative of, nor intended to forecast, the future performance of our common stock.

Equity Compensation Plan Information

In March 2010, our shareholders approved the adoption of a stock and option award plan (the 2010 Plan), under which 2,500,000 shares were reserved for future issuance under restricted stock awards, options, and other equity awards. The 2010 Plan permits grants of equity awards to employees, directors and consultants. In August 2010, the number of shares issuable under the 2010 Plan was increased to 4,500,000 shares by consent of our majority shareholders. At the annual shareholders meeting, held in December 2011, the number of shares issuable under the 2010 Plan was increased to 5,700,000. At the annual shareholders meeting held in December 2012, the number of shares issuable under the 2010 Plan was further increased to 8,200,000 and in December 2013, total shares issuable was increased to 11,700,000. The following table displays equity compensation plan information as of December 31, 2014.

Plan Category	Number of Securities Remaining Available for Issuance under Equity Compensation Plans		
	Number of Securities to be Issued upon Exercise of Outstanding Options (a)	Weighted-Average Exercise Price of Outstanding Options in Column (a) (b)	(Excluding Securities Reflected in Column (a)) (c)
Equity compensation plans approved by security holders	6,568,248	\$ 3.82	3,755,771
Equity compensation plans not approved by security holders			
Total	6,568,248	\$ 3.82	3,755,771

Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations

You should read the following discussion and analysis of our financial condition and results of operations together with our financial statements and the related notes appearing elsewhere in this report. Some of the information contained in this discussion and analysis, including information with respect to our plans and strategy for our business and related financing, includes forward-looking statements that involve risks and uncertainties. You should

read the Risk Factors section of this Form 10-K for a discussion of important factors that could cause actual results to differ materially from the results described in or implied by the forward-looking statements contained in the following discussion and analysis.

Overview

Ampio Pharmaceuticals, Inc. is a biopharmaceutical company focused primarily on the development of therapies to treat prevalent inflammatory conditions for which there are limited treatment options. Ampio's two lead product candidates in development are Ampion for osteoarthritis of the knee and Optina for diabetic macular edema. We are also focused on developing and monetizing our ORP diagnostic device and sexual dysfunction portfolio.

Dose Ranging SPRING Pivotal Trial Results

On August 14, 2013, we announced results of the SPRING study of Ampion for the treatment of osteoarthritis of the knee. The SPRING study was a U.S. multicenter randomized (1:1:1:1), double-blind, vehicle controlled trial designed to evaluate the safety and efficacy of Ampion in osteoarthritis of the knee patients. 329 patients were randomized to receive one of two doses (4 mL or 10 mL)

Table of Contents

of Ampion or corresponding saline control via intra-articular injection. The primary study objective was to evaluate the relative efficacy of Ampion 4 mL versus Ampion 10 mL. The primary endpoint was mean change in pain as measured on the WOMAC A, from baseline for Ampion compared to the same volume of saline. Secondary endpoints included evaluating safety and disease severity, as well as stiffness and function. Both Ampion dose cohorts experienced statistically significant reductions in pain compared to control, and there were no significant differences between the efficacy of the two Ampion doses, as such, the lowest required dose, 4mL, was selected as the optimal dose. A brief summary of the combined Ampion topline results is as follows:

Patients receiving Ampion achieved significantly greater reduction in pain, WOMAC A, from baseline to 12 weeks compared to saline vehicle control ($p = 0.004$).

Patients receiving Ampion experienced, on average, a greater than 40% reduction in pain from baseline.

Patients receiving Ampion achieved significantly greater reduction in pain, WOMAC A, across 12 weeks compared to saline vehicle control ($p = 0.01$).

Patients receiving Ampion also achieved significantly greater improvement in function, (WOMAC C), from baseline to 12 weeks compared to saline vehicle control ($p = 0.044$).

Patients receiving Ampion also demonstrated significantly greater improvement in Patient Global Assessment (PGA) of disease severity from baseline to 12 weeks compared to saline vehicle control ($p = 0.012$).

Clinical efficacy defined as pain reduction was evident as early as four weeks after the injection ($p = 0.025$) and continued to show improvement through 12 weeks ($p = 0.0038$).

Severe patients, defined as Kellgren-Lawrence IV, receiving Ampion achieved significantly greater reduction in pain, WOMAC A, from baseline to 12 weeks compared to severe patients receiving saline vehicle control ($p = 0.017$).

Ampion was well tolerated with minimal adverse events (AEs) reported in the study. AEs were well balanced between Ampion and control groups. There were no drug-related serious adverse events (SAEs). On February 4, 2014, we announced that an article reporting the results of the SPRING study was published in PLOSE ONE, an international, open-access, online publication. The article entitled: A Randomized Clinical Trial to Evaluate Two Doses of an Intra-Articular Injection of LMWF-5A in Adults with Pain Due to Osteoarthritis of the Knee details the efficacy and safety outcomes of the use of Ampion in the SPRING study.

Due to the robust results at week 12, we decided to amend the protocol to include an ad hoc visit at 20 weeks and called all subjects to come back in for a visit; 97 patients returned. At week twenty, 50% of patients in the

Kellgren-Lawrence grades of 3 and 4 (severe osteoarthritis) had improvement of 40% or more in the WOMAC A pain scale compared to 25% in the vehicle control group ($p=0.04$). Patients were also classified as responders if they achieved 40% or greater improvement in pain, WOMAC A, and function, WOMAC C, at and over 20 weeks after a single intra-articular injection into the knee. In these same grade 3 and 4 patients, there was a statistically significant improvement in pain, WOMAC A, compared to the vehicle control both at week 20 ($p=0.02$) and over the whole period of 20 weeks ($p=0.005$). Also in these same grade 3 and 4 patients, there was a statistically significant improvement in function, WOMAC C, compared to vehicle control both at week 20 ($p=0.05$) and over the whole period of 20 weeks ($p=0.04$).

STEP Trial

On January 13, 2014, we announced the first patient injection in the Phase III clinical trial of Ampion for the treatment of osteoarthritis of the knee. The Phase III STEP study enrolled 538 patients and the primary endpoint was reduction in pain for patients treated with Ampion compared to vehicle control at 12 weeks. STEP was a randomized, placebo-controlled, double-blind study in which patients with osteoarthritis knee pain were randomized to receive either a 4 mL single injection of Ampion or saline control. The clinical effects of treatment on osteoarthritic pain were evaluated during clinic visits at 6, 12, and 20 weeks using WOMAC Osteoarthritis Index and the Patient Global Assessment. Safety was assessed by recording adverse events, concomitant medications, physical examination, vital signs and clinical laboratory tests. Despite significant efforts that were successfully implemented in other studies, there was a break down in temperature management during the distribution process of the STEP Study. Based upon this deviation, the product efficacy data for the BLA will be drawn from the SPRING and Multiple Injection studies.

Ongoing Clinical Trials

STRUT Trial

On June 30, 2014, we announced the beginning of a multiple injection study, the STRUT study, at a single site for patients with mostly severe or very severe osteoarthritis of the knee. The study is comprised of two phases; Phase I is an open-label, 7 patient, single center trial to analyze the safety of 4mL multiple injections (Baseline, Week 2 and Week 4) and Phase II is a randomized, 40

Table of Contents

patient, single center trial to analyze the efficacy and safety of multiple injections (Baseline, Week 2 and Week 4). Phase II of the STRUT study would only commence after safety review of the Phase I trial results at 4 weeks. On August 5, 2014, we reported no serious drug related adverse events were reported in Phase I of the STRUT study and a 65% improvement in pain (WOMAC A pain subscore improved from 2.2 (0.55) to 0.8 (0.62), mean difference 1.43 (0.406) $p=0.001$) was observed at one month post-injection. In addition, the function score of WOMAC C improved by 74% compared to baseline at 4 weeks. With these positive results, Ampio proceeded with the randomized Phase II portion of the STRUT study. On October 16, 2014 we announced that enrollment was complete for Phase II of the STRUT study. On December 1, 2014, we announced the results from the Phase I open label portion of the study at 20 weeks. The primary endpoint, WOMAC A pain score, improved by 91.2% from baseline to 20 weeks in the Phase I open label portion of the study. Additionally, the WOMAC A mean (SD) significantly improved from 2.27 (0.59) at baseline, to 0.20 (0.23) at week 20, mean difference (95% CI) -2.03 (-2.83,-1.23), $p=0.001$. The secondary endpoint measurement of stiffness, also improved significantly by 87% from baseline at week 20 from mean (SD) of 2.75 (0.82) to 0.36 (0.48), mean difference (95% CI) 2.33 (-3.51,-1.15) $p=0.004$. The secondary endpoint of a validated measure of simple daily physical functions improved by 91.3% from baseline at week 20. This improvement was statistically significant, going from 2.32 (0.60) at baseline to 0.20 (0.34) at week 20; mean (95% CI) improvement of 2.09 (-2.96,-1.21), $p=0.002$. The 20 week data collection point from the Phase II randomized portion of the STRUT study will be completed in the first quarter of 2015.

STRIDE Trial

On October 16, 2014, we announced treatment had begun in the randomized (1:1), vehicle controlled, multiple injection (4mL at Baseline, Week 2 and Week 4), multi-center STRIDE study with 320 patients. On November 12, 2014, we announced that 320 patients had been enrolled and received at least the first injection in the STRIDE study. We expect that the 20 week end point of this study will occur early in the second quarter of 2015.

Optina Clinical Trials in Support of a §505(b)(2) New Drug Application (NDA)

The FDA has indicated that, for §505(b)(2) NDAs, complete studies of the safety and effectiveness of a candidate product may not be necessary if appropriate bridging studies provide an adequate basis for reliance upon FDA's findings of safety and effectiveness for a previously approved product. On November 12, 2014 we announced the clinical trial in support of a §505(b)(2) application for Optina, OptimEyes, was complete and included 355 patients. The U.S. multicenter dose ranging trial was designed to evaluate the safety and efficacy of oral Optina compared with placebo over 12 weeks in adult patients with DME. The active treatment duration of 12 weeks was the maximum time allowed to withdraw treatment in the ophthalmology community. Patients were randomized (1:1:1) to receive one of two oral doses of Optina, 0.5 mg per BMI and 1.0 mg per BMI per day, or placebo. The primary endpoint is improvement in best-corrected visual acuity in treated patients compared to a placebo. Secondary endpoints are (i) measurements of changes in central macular thickness in treated patients compared to a placebo and (ii) safety and tolerability of the two Optina doses. Optina is a systemic therapy and the blood levels of danazol are affected by body composition. Therefore, blood levels of danazol play an important role in the interpretation of results. An independent laboratory has been engaged and is working to analyze the blood samples gathered during the clinical study. At this same time, our scientific and regulatory staff and our CRO were fully engaged in completing the Ampion STRUT and STRIDE clinical trials, it was decided to retain their focus on that effort rather than divide their attention. Once the Ampion clinical trials are complete and the outcome data reported to shareholders, management focus will be shifted back to compiling and reporting the Optina clinical trial results.

Additionally, patients from the active treatment arms of the trial were followed for four weeks without treatment following the 12 week treatment period in order to study any regression of effect. All patients were also given the option to enter into an open label extension of the trial. The open label study will evaluate patients' improvement in

BCVA over 12 weeks by administering the optimal dose of Optina. The optimal dose was determined by an interim analysis occurring at week 4 involving approximately 150 patients. We announced in October 2013 that an independent data review committee (IDRC) recommended the continuation of the study after an unmasked interim analysis which found that there was a treatment dosage demonstrating a potentially beneficial anatomic effect, and there were no significant safety concerns. Based on the outcome of the interim analysis, Ampio initiated an open label extension study for those patients who have completed the trial and wish to remain on Optina and offer patients who received placebo in the primary study a chance to cross-over to undergo treatment with the active treatment. The open label extension portion of the trial is now complete. This data should be released in conjunction with the primary study as noted above.

Future Development

While we believe the data from a single clinical trial could support a NDA filing, we will assess the need for an additional trial in conjunction with the FDA if we have a successful outcome of the trial in support of the §505(b)(2) NDA. The FDA has previously indicated that a Phase III trial may be necessary following the current trial. During this current trial, we also gathered data on patients' proteinuria levels. If Optina proves to be successful in inhibiting vascular permeability, we will assess the prospects of Optina for treatment of other diabetic angiopathies such as diabetic nephropathy.

Table of Contents

Recent Financing Activities

In September 2011, we filed a shelf registration statement on Form S-3 with the Securities and Exchange Commission to register Ampio common stock and warrants in an aggregate amount of up to \$80.0 million for offering from time to time. The registration statement also registered for possible resale up to one million shares of common stock to be sold by directors and management (as selling shareholders) in future public offerings. As of December 31, 2014, this shelf registration statement is no longer effective.

In July 2012, we completed an underwritten public offering for the sale of 5,203,860 shares of common stock at a price of \$3.25 per share. Gross proceeds to Ampio were \$16.9 million with net proceeds of \$15.4 million after underwriter fees and cash offering expenses. We also issued warrants to purchase 138,462 shares of common stock to the underwriters. These warrants have an exercise price of \$4.0625 and can be exercised from the period July 12, 2013 through July 12, 2017. Certain shareholders also sold shares and received gross proceeds of \$926,575 from the offering of 285,100 shares as provided in the registration statement. The net proceeds of the 2012 offering have been or will be used for general corporate purposes and working capital, including completion of the Ampion and Optina clinical trials and costs related to the regulatory approval and commercialization of Zertane.

In January 2013, we formed a subsidiary, Luoxis Diagnostics, Inc. (Luoxis) to focus on the development and commercialization of our Oxidation Reduction Potential (ORP) technology platform. Luoxis was funded through a private placement which had a final closing in May 2013 with \$4.7 million in gross proceeds. Net proceeds were \$4.0 million after placement agent and legal fees. The placement agent also received 465,250 warrants to purchase Luoxis common stock valued at \$313,064 in connection with the closing. Prior to the private placement, Ampio incurred all of the costs associated with the development of the ORP platform. As a result of the private placement, Ampio now owns 80.9% of Luoxis.

In September 2013, we closed on the sale of 4,600,319 shares of common stock at \$5.50 per share, for a total of \$25.3 million of gross proceeds and \$25.0 million net proceeds after offering costs. The sale of the common stock was made pursuant to the Form S-3 Shelf Registration.

In December 2013, Ampio filed an additional shelf registration statement on Form S-3 with the Securities and Exchange Commission to register Ampio common stock and warrants in an aggregate amount of up to \$100.0 million for offering from time to time in the future, as well as 1.5 million shares of common stock available for sale by selling shareholders. The shelf registration was declared effective in January 2014 by the Securities and Exchange Commission. As a result of the subsequent equity raises, approximately \$86.3 million remains available under the Form S-3 filed in December 2013.

In March 2014, Ampio completed an underwritten public offering for the sale of 9,775,000 shares of common stock at a price of \$7.00 per share. Gross proceeds to the Company were \$68.4 million with net proceeds of \$63.4 million after underwriter fees and cash offering expenses.

Known Trends or Future Events; Outlook

We have not generated any significant revenues and have therefore incurred significant net losses totaling \$101.9 million since our inception in December 2008. The assets we purchased from BioSciences in April 2009 generated minimal revenues prior to their acquisition. We expect to generate operating losses for the foreseeable future, but intend to try to limit the extent of these losses by entering into co-development or collaboration agreements with one or more strategic partners. Although we have raised capital in the past and with net proceeds of \$63.4 million, \$28.9 million and \$15.4 million through the sale of common stock in 2014, 2013 and 2012, respectively, we cannot assure

you that we will be able to secure such additional financing, if needed, or that it will be adequate to execute our business strategy. Even if we obtain additional financing, it may be costly and may require us to agree to covenants or other provisions that will favor new investors over existing shareholders.

Our primary focus is advancing the clinical development of our core assets: Ampion and Optina. In December 2013, we entered into a ten-year lease of a multi-purpose facility containing approximately 19,000 square feet. This facility includes an FDA compliant clean room to manufacture Ampion and our corporate offices.

Significant Accounting Policies and Estimates

Our consolidated financial statements have been prepared in accordance with accounting policies generally accepted in the United States of America. The preparation of the consolidated financial statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities at the date of the consolidated financial statements and the reported amounts of expenses during the reporting period. On an on-going basis, management evaluates its estimates and judgments, including those related to recoverability and useful lives of long-lived assets, fair value of our derivative instruments, allowances and contingencies. Management bases its estimates and judgments on historical experience and on various other factors that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying value of assets and liabilities that are not readily apparent from other sources. Actual results may differ from these estimates under different assumptions or conditions. The methods, estimates, and judgments used by us in applying these most critical accounting policies have a significant impact on the results we report in our consolidated financial statements.

Below is a discussion of the policies and estimates that we believe involve a high degree of judgment and complexity.

Principals of Consolidation

These consolidated financial statements include the accounts of Ampio and its wholly-owned and majority-owned subsidiaries. All material intercompany transactions and balances have been eliminated.

Cash and Cash Equivalents

Ampio considers all highly liquid instruments purchased with an original maturity of three months or less to be cash equivalents. Cash equivalents consist primarily of money market fund investments. Ampio's investment policy is to preserve principal and maintain liquidity. Ampio periodically monitors its positions with, and the credit quality of, the financial institutions with which it invests. Periodically, throughout the year, Ampio has maintained balances in excess of federally insured limits.

Revenue Recognition/Deferred Revenue

Payments received upon signing of license agreements are for the right to use the license and are deferred and amortized over the lesser of the license term or patent life of the licensed drug. Milestone payments relate to obtaining regulatory approval in the territory, cumulative sales targets, and other projected milestones and are recognized at the time the milestone requirements are achieved. Royalties will be recognized as revenue when earned.

Fixed Assets

Fixed assets are recorded at cost and after being placed in service, are depreciated using the straight-line method over estimated useful lives.

In-Process Research and Development

In-process research and development (IPRD) relates to the Zertane product and clinical trial data acquired in connection with the March 2011 business combination of BioSciences acquisition of DMI BioSciences. The \$7,500,000 recorded was based on an independent third party appraisal of the fair value of the assets acquired. IPRD is considered an indefinite-lived intangible asset and its

Table of Contents

fair value will be assessed annually and written down if impaired. Once the Zertane product obtains regulatory approval and commercial production begins, IPRD will be reclassified to an intangible that will be amortized over its estimated useful life. If the Company decided to abandon the Zertane product, the IPRD would be expensed.

Patents

Costs of establishing patents, consisting of legal and filing fees paid to third parties, are expensed as incurred. The fair value of the Zertane patents, determined by an independent, third party appraisal to be \$500,000, acquired in connection with the 2011 acquisition of BioSciences is being amortized over the remaining U.S. patent lives of approximately 11 years. The fair value of the Luoxis patents was \$380,000 when they were acquired in connection with the 2013 formation of Luoxis and is being amortized over the remaining U.S. patent lives of approximately 15 years.

Use of Estimates

The preparation of consolidated financial statements in accordance with Generally Accepted Accounting Principles in the United States of America (GAAP) requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, disclosures of contingent assets and liabilities as of the date of the consolidated financial statements and the reported amounts of revenues and expenses during the reporting periods. Significant items subject to such estimates and assumptions include the fair value of warrant derivative liability, hybrid debt instruments, valuation allowances, stock-based compensation and assumptions in evaluating impairment of indefinite lived assets. Actual results could differ from these estimates.

Derivatives

Ampio accounted for hybrid financial instruments (debentures with embedded derivative features conversion options, down-round protection and mandatory conversion provisions) and related warrants by recording the fair value of each hybrid instrument in its entirety and recording the fair value of the warrant derivative liability. The fair value of the hybrid financial instruments and related warrants was calculated using a binomial-lattice-based valuation model. Ampio recorded a derivative expense at the inception of each instrument reflecting the difference between the fair value and cash received. Changes in the fair value in subsequent periods were recorded as unrealized gain or loss on fair value of debt instruments for the hybrid financial instruments and to derivative income or expense for the warrants. Accounting for hybrid financial instruments and derivatives is discussed more fully in Note 5 Derivative Financial Instruments. The fair value of warrants issued in connection with the common stock offerings was valued using a Black-Scholes option pricing model.

Income Taxes

Deferred taxes are provided on an asset and liability method whereby deferred tax assets are recognized for deductible temporary differences and operating loss and tax credit carry forwards and deferred tax liabilities are recognized for taxable temporary differences. Temporary differences are the differences between the reported amounts of assets and liabilities and their tax bases. Deferred tax assets are reduced by a valuation allowance when, in the opinion of management, it is more likely than not that some portion or all of the deferred tax assets will not be realized. Deferred tax assets and liabilities are adjusted for the effects of changes in tax laws and rates on the date of enactment.

Net Loss per Common Share

Basic net loss per share includes no dilution and is computed by dividing the net loss available to common stockholders by the weighted-average number of shares outstanding during the period. Diluted net loss per share reflects the potential of securities that could share in the net loss of Ampio. Basic and diluted loss per share was the same in 2014, 2013 and 2012. Although there were common stock equivalents of 7,084,577, 5,662,748, and 5,677,186 shares outstanding at December 31, 2014, 2013 and 2012, respectively, consisting of stock options and warrants; they were not included in the calculation of the diluted net loss per share because they would have been anti-dilutive.

Stock-Based Compensation

Ampio accounts for share based payments by recognizing compensation expense based upon the estimated fair value of the awards on the date of grant. Ampio determines the estimated grant fair value using the Black-Scholes option pricing model and recognizes compensation costs ratably over the vesting period using the graded method.

Table of Contents

Research and Development

Research and development costs are expensed as incurred with expense recorded in the respective periods.

Fair Value of Financial Instruments

The carrying amounts of financial instruments, including cash and cash equivalents, accounts payable and other current assets and liabilities are carried at cost which approximates fair value due to the short maturity of these instruments. Hybrid financial instruments such as convertible debentures and related warrants were recorded at estimated fair value based on a binomial-lattice-based valuation model.

Impairment of Long-Lived Assets

Ampio routinely performs an annual evaluation of the recoverability of the carrying value of its long-lived assets to determine if facts and circumstances indicate that the carrying value of assets or intangible assets may be impaired and if any adjustment is warranted. Based on Ampio's evaluation as of December 31, 2014, no impairment existed for long-lived assets.

Non-Controlling Interest in Consolidated Financial Statements

Non-controlling interest is calculated based upon the investment made in the subsidiary and the percentage of ownership that investment gives the parent. Non-controlling interest is reflected under equity.

Newly Issued Accounting Pronouncements

In May 2014, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2014-09 regarding Accounting Standards Codification (ASC) Topic 606, Revenue from Contracts with Customers . The standard provides principles for recognizing revenue for the transfer of promised goods or services to customers with the consideration to which the entity expects to be entitled in exchange for those goods or services. The guidance will be effective for our fiscal year beginning January 1, 2017. Early adoption is not permitted. We are currently evaluating the accounting, transition and disclosure requirements of the standard and cannot currently estimate the financial statement impact of adoption.

In June 2014, the FASB issued ASU 2014-10, Development Stage Entities (Topic 915) . The guidance eliminates the definition of a development stage entity thereby removing the incremental financial reporting requirements from GAAP for development stage entities, primarily presentation of inception to date financial statements. The provisions of the amendments are effective for Ampio's calendar year 2015; however, early adoption is permitted and, accordingly, we elected to implement the guidance for our 2014 financial statements.

In August 2014, the FASB issued ASU 2014-15, Presentation of Financial Statements-Going Concern (Subtopic 205-40): Disclosure of Uncertainties about an Entity's Ability to Continue as a Going Concern (ASU 2014-15). ASU 2014-15 is intended to define management's responsibility to evaluate whether there is substantial doubt about an organization's ability to continue as a going concern and to provide related footnote disclosures. The amendments in this ASU are effective for reporting periods beginning after December 15, 2016, with early adoption permitted. Management is currently assessing the impact the adoption of ASU 2014-15 will have on our financial statements.

In January 2015, the FASB issued ASU 2015-01, Extraordinary and Unusual Items (Subtopic 225-20): Simplifying Income Statement Presentation by Eliminating the Concept of Extraordinary Items. The purpose of this amendment is

to eliminate the concept of extraordinary items. As a result, an entity will no longer be required to separately classify, present and disclose extraordinary events and transactions. The amendment is effective for annual reporting periods beginning after December 15, 2015 and subsequent interim periods with early application permitted. Management is currently assessing the impact the adoption of ASU 2015-01 will have on our financial statements.

Error in Classification

Patent costs were previously classified as research and development, however, it was determined that these costs were incorrectly classified and, therefore, have been reclassified as general and administrative expense for all periods presented. Patent costs consist of legal and filing fees related to obtaining and maintaining patents and should have been excluded from research and development activities as set forth in the FASB's Accounting Standards Codification topic 730, Research and Development. The impact of the correction of this error in classification decreased research and development expenses and correspondingly increased general and administrative expenses for the years ended December 31, 2013 and 2012 by \$1.7 million and \$1.4 million, respectively. The correction of this error had no impact on our total operating expenses or our net loss for any periods presented.

Results of Operations Year Ended December 31, 2014, 2013 and 2012 See Notes to Consolidated Financial Statements

Results of operations for the years ended December 31, 2014, 2013 and 2012 reflected losses of \$38.1 million, \$24.0 million and \$11.6 million, respectively. These losses include non-cash charges related to stock-based compensation, depreciation and amortization expense, amortization of prepaid research and development-related party, common stock issued for services, derivative expense (income), and loss on disposal of fixed assets totaling \$8.6 million, \$4.2 million and \$1.5 million in 2014, 2013 and 2012 respectively. Based upon the stock options that have been issued in 2014 and 2013, we would expect to continue to be above \$5.0 million for stock compensation in 2015. We would also expect to see depreciation and amortization or prepaid research and development to increase in 2015 compared to 2014 as more assets start to depreciate in 2015 from our build out of the manufacturing facility and the full year of amortization of prepaid research and development.

Revenue

We have not generated material revenue in our operating history. The \$77,000, \$50,000 and \$50,000 license revenue recognized during 2014, 2013 and 2012, respectively, represents the amortization of the upfront payments received on our license agreements. From an agreement entered into in 2012, the initial payment of \$500,000 from the license agreement of Zertane with a Korean pharmaceutical company was deferred and is being recognized over 10 years. As well as from an agreement entered into in 2014 with a Canadian-based supplier, the initial payment of \$250,000 from the license agreement of Zertane was deferred and is being recognized over seven years.

Table of Contents***Expenses******Research and Development***

Research and development costs consist of labor, stock-based compensation, clinical trials and sponsored research, consultants and sponsored research related party. These costs relate solely to research and development without an allocation of general and administrative expenses and are summarized as follows:

	Year Ended December 31,		
	2014	2013	2012
Labor	\$ 2,227,000	\$ 1,862,000	\$ 1,424,000
Stock-based compensation	4,641,000	1,997,000	396,000
Clinical trials and sponsored research	19,071,000	12,078,000	3,755,000
Sponsored Research - related party	304,000	46,000	
Consultants and other	680,000	613,000	469,000
	\$ 26,923,000	\$ 16,596,000	\$ 6,044,000

Comparison of Years Ended December 31, 2014 and 2013

Research and development expenses increased \$10,327,000, or 62%, in 2014 over 2013. This was due primarily to costs associated with the production of study drugs, clinical trials of Ampion and Optina and the Luoxis development of its ORP platform. Stock-based compensation increased due to stock options granted in Ampio, Luoxis and Vyrax as well as the continuing vesting of stock option awards granted in previous years. Research and development expense in 2015 is expected to stay consistent with where it was in 2014 but this could materially change based upon the outcomes of the Ampion and Optina trials, which we expect to finalize in the first half of 2015. We expect research and development labor and stock-based compensation to increase slightly in 2015 compared to 2014.

Comparison of Years Ended December 31, 2013 and 2012

Research and development expenses increased \$10,552,000, or 175%, in 2014 over 2013. This was due primarily to costs associated with the production of study drugs, clinical trials of Ampion and Optina and the Luoxis development of its ORP platform. Labor and stock-based compensation increased due to bonuses paid/accrued and stock options granted in both Ampio and Luoxis as well as the continuing vesting of stock option awards granted in previous years.

General and Administrative

General and administrative expenses consist of personnel costs for employees in executive, business development and operational functions and director fees; stock-based compensation; patents and intellectual property; professional fees include legal, auditing and accounting; occupancy, travel and other includes rent, governmental and regulatory compliance, insurance, investor/public relations and professional subscriptions. These costs are summarized as follows:

	Year Ended December 31,		
	2014	2013	2012
Labor	\$ 2,326,000	\$ 1,538,000	\$ 1,308,000
Stock-based compensation	3,242,000	1,539,000	1,227,000
Patent costs	2,241,000	1,738,000	1,449,000
Professional fees	1,689,000	735,000	399,000
Occupancy, travel and other	2,481,000	1,721,000	1,191,000
Directors fees	246,000	206,000	252,000
	\$ 12,225,000	\$ 7,477,000	\$ 5,826,000

Table of Contents*Comparison of Years Ended December 31, 2014 and 2013*

General and administrative costs increased \$4,748,000 or 64%, in 2014 over 2013. The increase in labor costs and stock-based compensation primarily relates to increased professional staffing, bonuses earned and stock options granted in Ampio, Luoxis and Vyrix as well as the continuing vesting of stock option awards granted in previous years. The increase in professional fees is related to Ampio's legal defense costs for a case that Ampio was found to have no liability and had to pay no settlement fee. Also, the legal costs associated with Vyrix trying to complete an initial public offering during 2014 were expensed. During 2015, we would expect that general and administrative costs will stay in the same range as 2014 as legal costs could stay at this higher run rate as the Company explores options on the best ways to complete the regulatory process and commercialize Ampion and Optina as well as potentially exploring its options to unlock the potential value of Luoxis and Vyrix to the our shareholders.

Comparison of Years Ended December 31, 2013 and 2012

General and administrative costs increased \$1,651,000, or 28%, in 2013 over 2012. The increase in labor costs and stock-based compensation primarily relates to the addition of our chief operating officer in December 2012, increased professional staffing in Luoxis, bonuses paid/accrued and stock options granted in both Ampio and Luoxis as well as the continuing vesting of stock option awards granted in previous years. The labor costs in 2012 includes an employment agreement payout to our former CEO. The increase in professional fees is associated with the formation of the subsidiaries for Luoxis and Vyrix and the fees associated with legal defense costs. Occupancy, travel and other increased primarily due to insurance premiums, regulatory and compliance fees and travel expenses.

Derivative Expense

We recorded approximately (\$517,000) and \$206,000 in non-cash derivative (expense) income in 2013 and 2012, respectively, in connection with our hybrid financial instruments consisting of debentures and related warrants. The expense relates to the fair value at inception and subsequent changes in fair value of the debentures issued in 2011 and 2010 stemming from the embedded derivative features (conversion options, down-round protection and mandatory conversion provisions) and the changes in fair value of warrants issued in conjunction with the debentures. The debentures were redeemed in 2011 and in 2013, all of the warrants were exercised prior to their expiration date of December 31, 2013. Since all of these warrants expired prior to 2014, there was no expense or income related to these warrants in 2014.

Net Cash Used in Operating Activities

During 2014, our operating activities used \$30.7 million in cash. The use of cash was \$8.3 million lower than the net loss due primarily to non-cash charges for stock-based compensation, depreciation and amortization. Cash provided in operating activities also included a \$1,020,000 increase in accounts payable and \$721,000 increase in deferred rent which were offset by increased prepaid research and development related party of \$1,340,000 and prepaid expense of \$541,000.

During 2013, our operating activities used approximately \$19.1 million in cash. The use of cash was \$5.4 million lower than the net loss due primarily to non-cash charges for stock-based compensation, depreciation and amortization, derivative expense and non-cash deferred revenue. Net cash provided in operating activities also included a \$522,000 increase in accrued compensation and \$699,000 increase in accounts payable.

During 2012 our operating activities used approximately \$9.7 million in cash. The use of cash was \$1.9 million lower than the net loss due to non-cash charges for stock-based compensation, depreciation and amortization and also

non-cash deferred revenue and derivative income. Net cash used in operating activities also included a \$122,000 increase in prepaid expenses and cash provided by a \$571,000 increase in accounts payable.

Net Cash Used in Investing Activities

During 2014, cash was used to acquire fixed assets which consists of the purchase of machinery and build out related to the in process manufacturing facility/clean room.

During 2013, cash was used to acquire ORP patents on behalf of Luoxis See Note 3 Formation of Subsidiaries. Fixed assets reflect purchases of machinery related to the in process manufacturing facility/clean room, a new server, a lab scope and a Luoxis ORP manufacturing device.

During 2012, cash was used for the payment of a deposit for our prior facility lease.

Table of Contents**Net Cash from Financing Activities**

Net cash provided by financing activities in 2014 was \$63.4 million which reflects net proceeds from our completed underwritten public offering and of stock option exercises.

Net cash provided by financing activities in 2013 was \$29.4 million which reflects net proceeds from the registered direct placement of \$25.0 million, Luoxis private financing of \$4.0 million and \$0.4 million from the exercise of stock options and warrants.

Net cash provided by financing activities in 2012 was \$16.0 million. During the year, Ampio completed an underwritten public offering, with net proceeds of \$15.4 million and options and warrants exercised of \$630,000. We also received a repayment of \$37,000 related to the stockholders advances that BioSciences made in 2010.

Contractual Obligations and Commitments

The following table summarizes the commitments and contingencies as of December 31, 2014 which are described below:

	Total	2015	2016	2017	2018	2019	Thereafter
Manufacturing Facility/Clean Room - in progress	\$ 151,000	\$ 151,000	\$	\$	\$	\$	\$
Ampion supply agreement	10,442,000	2,792,000	2,550,000	2,550,000	2,550,000		
Clinical research and trial obligations	5,847,000	5,847,000					
Sponsored research agreement with related party	1,381,000	325,000	325,000	325,000	325,000	81,000	
Facility lease	3,211,000	287,000	297,000	306,000	316,000	326,000	1,679,000
	\$ 21,032,000	\$ 9,402,000	\$ 3,172,000	\$ 3,181,000	\$ 3,191,000	\$ 407,000	\$ 1,679,000

Manufacturing Facility/Clean Room In Progress

The manufacturing facility/clean room will provide commercial scale, FDA compliant, GMP manufacturing of Ampion, an advanced research and development laboratory as well as sufficient office space to consolidate the core operations of the Company in a single facility.

Ampion Supply Agreement

To secure the supply of a critical component in our Ampion product, we have entered into a purchase agreement for human serum albumin with a total remaining commitment of \$10,442,000 as of December 31, 2014. In addition to our current supplier, we have identified three other potential suppliers of the human serum albumin within the United States.

Clinical Research and Trial Obligations

In connection with upcoming clinical trials, Ampio has a remaining commitment of \$2,727,000 on contracts related to the Ampion study drug and \$3,120,000 remaining contract commitments related to the Optina study drug.

Sponsored Research Agreement with Related Party

Ampio entered into a Sponsored Research Agreement with TRLLC, a related party, in September 2009. Under the terms of the Sponsored Research Agreement, Ampio is to provide personnel and pay for leased equipment. The Sponsored Research Agreement may be terminated without cause by either party on 180 days' notice. As further noted in Note 11 - Related Party Transactions in our financial statements, in March 2014, the Sponsored Research Agreement was extended through March 2019, including a no termination period through March 2017. In a subsequent Addendum, the parties also agreed to increase the equivalent value of the personnel provided by Ampio from \$264,000 to \$325,000 per year.

Facility Leases

In December 2013, Ampio entered into a 125 month non-cancellable operating lease for new office space and the manufacturing facility effective May 2014. The new lease has initial base rent of \$23,000 per month, with the total base rent over the term of the lease of approximately \$3.3 million and includes rent abatements and leasehold incentives. We recognize rental expense of the facility on a straight-line basis over the term of the lease. Differences between the straight-line net expenses on rent payments are classified as liabilities between current deferred rent and long-term deferred rent.

Table of Contents

Liquidity and Capital Resources

We have not generated significant revenue as our primary activities are focused on research and development, advancing our primary product candidates, and raising capital. As of December 31, 2014, we had cash and cash equivalents totaling \$50.3 million available to fund our operations and \$3.5 million in accounts payable and accrued compensation. Based upon our current plans, we believe our capital resources at December 31, 2014 will be sufficient to fund our currently planned operations into the second half of 2016. This projection is based on a number of assumptions that may prove to be wrong, and we could exhaust our available cash and cash equivalents earlier than presently anticipated. We may be required or choose to seek additional capital within the next 18 months to expand our clinical development activities for Ampion™ and Optina™ based on the positive results of our ongoing clinical trials, if we face challenges or delays in connection with our clinical trials, or to maintain minimum cash balances that we deem reasonable and prudent. In addition, we intend to evaluate the capital markets from time to time to determine whether to raise additional capital in the form of equity, convertible debt or otherwise, depending on market conditions relative to our need for funds at such time, and we may seek to raise additional capital within the next 18 months should we conclude that such capital is available on terms that we consider to be in the best interests of us and our stockholders.

We have prepared a budget for 2015 which reflects cash requirements for fixed, on-going expenses such as payroll, legal and accounting, patents and overhead at an average cash burn rate of approximately \$1.1 million per month. Additional funds are planned for regulatory approvals, clinical trials, outsourced research and development and commercialization consulting. We have also budgeted for additional funding to be provided for our subsidiaries. Accordingly, it may be necessary to raise additional capital and/or enter into licensing or collaboration agreements. At this time, we expect to satisfy our future cash needs through private or public sales of our securities or debt financings. We cannot be certain that financing will be available to us on acceptable terms, or at all. Over the last three years, volatility in the financial markets has adversely affected the market capitalizations of many pharmaceutical companies and generally made equity and debt financing more difficult to obtain. This volatility, coupled with other factors, may limit our access to additional financing.

If we cannot raise adequate additional capital in the future when we require it, we will be required to delay, reduce the scope of, or eliminate one or more of our research or development programs or our commercialization efforts. We also may be required to relinquish greater or all rights to product candidates at an earlier stage of development or on less favorable terms than we would otherwise choose. This may lead to impairment or other charges, which could materially affect our balance sheet and operating results.

We have not generated any revenue from product sales to date, and we may never generate any revenue from product sales. We have funded our operations primarily through private and public offerings of our common stock and through the \$750,000 up-front payments we received from Daewoong Pharmaceuticals Co., Ltd. (Daewoong) and Paladin Labs Inc, (Paladin) in connection with license, development and commercialization agreements. We have incurred cumulative net losses of \$101.9 million through December 31, 2014, and we expect to incur substantial additional losses for the foreseeable future as we pursue regulatory approval for, and, if approved, commercial launch of our product candidates, and continue to finance clinical and preclinical studies of our existing and potential future product candidates and our corporate overhead costs.

Off Balance Sheet Arrangements

We do not have off-balance sheet arrangements, financings, or other relationships with unconsolidated entities or other persons, also known as variable interest entities.

Impact of Inflation

In general, we believe that our operating expenses can be negatively impacted by increases in the cost of clinical trials due to inflation and rising health care costs.

Item 7A. *Quantitative and Qualitative Disclosures about Market Risks*

Our business is not currently subject to material market risk related to financial instruments, equity or commodities.

Item 8. *Financial Statements and Supplementary Data*

The Financial Statements and Supplementary Data required by this item are located in Item 15 of Part IV, *Index to Financial Statements* at page F-1 of this annual report on Form 10-K and are incorporated herein by reference.

Table of Contents

Item 9. *Changes in and Disagreements with Accountants on Accounting and Financial Disclosure*
None

Item 9A. *Controls and Procedures*
Evaluation of Disclosure Controls and Procedures

We maintain disclosure controls and procedures, as such term is defined in Rules 13a-15(e) and 15d-15(e) of the Securities Exchange Act of 1934 (the Exchange Act), that are designed to ensure that information required to be disclosed by us in reports that we file or submit under the Exchange Act is recorded, processed, summarized, and reported within the time periods specified in SEC rules and forms, and that such information is accumulated and communicated to our management, including our chief executive officer and chief financial officer, as appropriate, to allow timely decisions regarding required disclosure.

As of the end of the period covered by this report, we carried out an evaluation, under the supervision and with the participation of senior management, including the chief executive officer and the chief financial officer, of the effectiveness of the design and operation of our disclosure controls and procedures pursuant to Exchange Act Rules 13a-15(b) and 15d-15(b). Based upon this evaluation, the chief executive officer and the chief financial officer concluded that our disclosure controls and procedures as of the end of the period covered by this report were effective at the reasonable assurance level.

Management's Annual Report on Internal Control over Financial Reporting

Our management is responsible for establishing and maintaining adequate internal control over financial reporting (as such term is defined in Rules 13a-15(f) under the Exchange Act). Our management assessed the effectiveness of our internal control over financial reporting as of December 31, 2014. In making this assessment, our management used the criteria set forth by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) in *Internal Control-Integrated Framework (2013)*. Our management has concluded that, as of December 31, 2014, our internal control over financial reporting is effective based on these criteria.

EKS&H LLLP, the independent registered public accounting firm that audited our consolidated financial statements included in this annual report on Form 10-K, has issued an attestation report on our internal control over financial reporting, which is included herein at F-2.

Changes in Internal Control over Financial Reporting

There were no changes in our internal controls over financial reporting, known to the chief executive officer or the chief financial officer that occurred during the period covered by this report that has materially affected, or is reasonably likely to materially affect, our internal control over financial reporting.

Item 9B. *Other Information*
None.

Table of Contents**PART III****Item 10. Directors and Executive Officers, and Corporate Governance**

The following table sets forth the names, ages and positions of our executive officers and directors as of February 1, 2015.

Principal Occupation and Areas of

Name	Age	Position With Ampio	Relevant Experience For Directors	Director Since
Michael Macaluso	63	Chief Executive Officer and Chairman of the Board	<p>Mr. Macaluso founded Life Sciences and has been a member of the board of directors of Life Sciences, our predecessor, since its inception. Mr. Macaluso has also been a member of our Board of Directors since the merger with Chay Enterprises in March 2010 and our Chief Executive Officer since January 9, 2012. Mr. Macaluso was appointed president of Isolagen, Inc. (AMEX: ILE) and served in that position from June 2001 to August 2001, when he was appointed chief executive officer. In June 2003, Mr. Macaluso was re-appointed as president of Isolagen and served as both chief executive officer and president until September 2004. Mr. Macaluso also served on the board of directors of Isolagen from June 2001 until April 2005. From October 1998 until June 2001, Mr. Macaluso was the owner of Page International Communications, a manufacturing business. Mr. Macaluso was a founder and principal of International Printing and Publishing, a position Mr. Macaluso held from 1989 until 1997, when he sold that business to a private equity firm.</p> <p>Mr. Macaluso's experience in executive management and marketing within the pharmaceutical industry, monetizing company opportunities, and corporate finance led to the conclusion of our Board of Directors that he should serve as a director of our company in light of our business and structure.</p>	March 2010

David Bar-Or, M.D.	66	Chief Scientific Officer and Director	<p>Dr. Bar-Or has served as our chief scientific officer since March 2010. Dr. Bar-Or also served as our chairman of the Board from March 2010 until May 2010. From April 2009 until March 2010, he served as chairman of the board and chief scientific officer of Life Sciences. Dr. Bar-Or is currently the director of Trauma Research at Swedish Medical Center, Englewood, Colorado, and St. Anthony's Hospital, Lakewood, Colorado. Dr. Bar-Or is the founder of Ampio Pharmaceuticals Inc. Dr. Bar-Or is principally responsible for all patented and proprietary technologies acquired by us from BioSciences in April 2009 and for all patents issued and applied for since then, having been issued over 270 patents and having filed or co-filed almost 120 patent applications. Dr. Bar-Or has authored or co-authored over 105 peer-reviewed journal articles and several book chapters. Is the recipient of the Gustav Levi Award from the Mount Sinai Hospital, New York, New York, the Kornfeld Award for an outstanding MD Thesis, the Outstanding Resident Research Award from the Denver General Hospital, and the Outstanding Clinician Award for the Denver General Medical Emergency Resident Program. Dr. Bar-Or received his medical degree from The Hebrew University, Hadassah Medical School, Jerusalem, Israel, following which he completed a biochemistry fellowship at Hadassah Hospital under Professor Alisa Gutman and undertook post-graduate work at Denver Health Medical Center, specializing in emergency medicine, a discipline in which he is board certified. He completed the first research fellowship in Emergency Medicine at Denver Health Medical Center under the direction of Prof Peter Rosen.</p>	March 2010

Table of Contents

Name	Age	Position With Ampio	Principal Occupation and Areas of Relevant Experience For Directors	Director Since
Philip H. Coelho ⁽¹⁾⁽²⁾⁽³⁾	71	Director	Among other experience, qualifications, attributes and skills, Dr. Bar-Or's medical training, extensive involvement and inventions in researching and developing our product candidates, and leadership role in his hospital affiliations led to the conclusion of our Board of Directors that he should serve as a director of our company in light of our business and structure.	April 2010
<p>Mr. Coelho has served as a member of our Board of Directors since April 2010. Mr. Coelho is the Chief Technology Officer and Co-Founder of SynGen Inc., a firm inventing and commercializing products that provide advanced cell separation and purification tools and accessories to aid regenerative medicine workflows. Prior to founding SynGen Inc. in October 2009, Mr. Coelho was the President and CEO of PHC Medical, Inc., a consulting firm, from August 2008 through October 2009. From August 2007 through May 2008, Mr. Coelho served as the Chief Technology Architect of ThermoGenesis Corp., a medical products company he founded in 1986 that focused on the regenerative medicine market. From 1989 through July 2007, he was Chairman and Chief Executive Officer of ThermoGenesis Corp. Mr. Coelho served as Vice President of Research & Development of ThermoGenesis from 1986 through 1989. Mr. Coelho has been in the senior management of high technology consumer electronic or medical device companies for over 30 years. He was President of Castleton Inc. from 1982 to 1986, and President of ESS Inc. from 1971 to 1982. Mr. Coelho also</p>				

serves as a member of the board of directors of Nasdaq-listed company, Catalyst Pharmaceuticals Partners, Inc. (CPRX) (since October 2002), and served as a member of the Board of Directors of NASDAQ-listed Mediware Information Systems, Inc. (MEDW) (from December 2001 until July 2006, and commencing again in May 2008 until it was sold in December 2012). Mr. Coelho received a B.S. degree in thermodynamic and mechanical engineering from the University of California, Davis and has been awarded more than 30 U.S. patents in the areas of cell cryopreservation, cryogenic robotics, cell selection, blood protein harvesting and surgical homeostasis.

Mr. Coelho's long tenure as a chief executive officer of a public medical device company, as director of a public pharmaceutical company, prior and current public company board experience, and knowledge of corporate finance and governance as an executive and director, as well as his demonstrated success in developing patented technologies, led to the conclusion of our Board of Directors that he should serve as a director of our company in light of our business and structure.

Richard B. Giles ⁽¹⁾⁽²⁾⁽³⁾	65	Director	Mr. Giles, CPA, has served as a member of our Board of Directors since August 2010. Mr. Giles is the Chief Financial Officer of Ludvik Electric Co., an electrical contractor headquartered in Lakewood, Colorado, a position he has held since 1985. Ludvik Electric is a private electrical contractor with 2013 revenues of \$89 million that has completed electrical	August 2010

Table of Contents

Name	Age	Position With Ampio	Principal Occupation and Areas of Relevant Experience For Directors	Director Since
David R. Stevens, Ph.D. ⁽¹⁾⁽²⁾	65	Director	<p>contracting projects throughout the United States, South Africa and Germany totaling more than \$1.6 billion. As CFO and Treasurer of Ludvik Electric, Mr. Giles oversees accounting, risk management, financial planning and analysis, financial reporting, regulatory compliance, and tax-related accounting functions. He serves also as the trustee of Ludvik Electric Co.'s 401(k) plan. Prior to joining Ludvik Electric, Mr. Giles was for three years an audit partner with Higgins Meritt & Company, then a Denver, Colorado CPA firm, and during the preceding nine years he was an audit manager and a member of the audit staff of Price Waterhouse, one of the legacy firms which now comprises PricewaterhouseCoopers. While with Price Waterhouse, Mr. Giles participated in a number of public company audits, including one for a leading computer manufacturer. Mr. Giles received a B.S. degree in accounting from the University of Northern Colorado. He is a member of the American Institute of Certified Public Accountants, Colorado Society of Certified Public Accountants, Construction Financial Management Association and Financial Executives International.</p> <p>Mr. Giles' experience in executive financial management, accounting and financial reporting, and corporate accounting and controls led to the conclusion of our Board of Directors that he should serve as a director of our company in light of our business and structure.</p>	June 2011

Micro-Imaging Solutions, LLC, a private medical device company. He has served on the boards of several other public and private life science companies, including Cedus, Inc., (2006-2014), Poniard Pharmaceuticals, Inc. (2006-2012), Aqua Bounty Technologies, Inc. (2002-2012), and Smart Drug Systems, Inc. (1999-2006), and was an advisor to Bay City Capital from 1999-2006. Dr. Stevens was previously President and CEO of Deprenyl Animal Health, Inc., a public veterinary pharmaceutical company, from 1990 to 1998, and Vice President, Research and Development, of Agrion Corp., a private biotechnology company, from 1986 to 1988. He began his career in pharmaceutical research and development at the former Upjohn Company, where he contributed to the preclinical evaluation of Xanax and Halcion. Dr. Stevens received B.S. and D.V.M. degrees from Washington State University, and a Ph.D. in Comparative Pathology from the University of California, Davis. He is a Diplomate of the American College of Veterinary Pathologists, and serves as a consulting experimental pathologist to Premier Laboratory, LLC.

Dr. Stevens has worked in the pharmaceutical and biotechnology industries since 1978. Dr. Stevens' experience in executive management in the pharmaceutical industry, and knowledge of the medical device industry led to the conclusion of our Board of Directors that he should serve as a director of our company in light of our business and structure.

Table of Contents

Name	Age	Position With Ampio	Principal Occupation and Areas of Relevant Experience For Directors	Director Since
Dr. Vaughan L. Clift	53	Chief Regulatory Affairs Officer	Dr. Clift has been employed by us since March 2010 and was employed by Life Sciences from May 2009 until March 2010. From 2005 to 2009, Dr. Clift was the chief executive officer of Detectachem LLC, a Houston, Texas-based manufacturer of a hand-held explosive and narcotics detection device. Dr. Clift was the Vice President of Operations, including all FDA regulatory matters, for Isolagen from 2002 until 2005. From January 2001 to May 2002, Dr. Clift researched home oxygen therapy systems while developing an oxygen system for NASA. From July 1997 to January 2001, he was Chief Scientist of DBCD, Inc., a medical device company that manufactures a range of blood diagnostic products for the human and veterinary markets. From May 1992 to June 1997, Dr. Clift was Chief Scientist for the Science Payload Development, Engineering and Operations project at Lockheed Martin's Human Spaceflight Division. Dr. Clift has received a number of international and federal awards and was nominated as one of NASA's top ten inventors in 1995.	
Gregory A. Gould	48	Chief Financial Officer, Treasurer and Secretary	Mr. Gould has been employed by us since June 2014. Prior to joining Ampio, he provided financial and operational consulting services to the biotech industry through his consulting company, Gould LLC from April 2012 until June 2014. Mr. Gould was Chief Financial Officer, Treasurer and Secretary of SeraCare from November 2006 until the company was sold to Linden Capital Partners in April 2012. During the period from July 2011 until April 2012 Mr. Gould also served as the Interim President and Chief Executive Officer of SeraCare Life Sciences. Mr. Gould has held several other executive positions at publicly traded life sciences	

companies including the Chief Financial Officer role at Atrix Laboratories, Inc., an emerging specialty pharmaceutical company focused on advanced drug delivery. During Mr. Gould's tenure at Atrix he was instrumental in the negotiation and sale of the company to QLT, Inc. for over \$855 million. He also played a critical role in the management of several licensing agreements including the global licensing agreement with Sanofi-Synthelabo of the Eligard® products. Mr. Gould was the Chief Financial Officer at Colorado MedTech, Inc., a publicly traded medical device design and manufacturing company where he negotiated the transaction to sell the company to KRG Capital Partners. Mr. Gould began his career as an auditor with Arthur Andersen, LLP. He currently serves on the board of directors of CytoDyn, Inc., a publicly traded drug development company pursuing anti-viral agents for the treatment of HIV. Mr. Gould graduated from the University of Colorado with a BS in Business Administration and is a Certified Public Accountant.

Joshua R. Disbrow 39 Chief Operating Officer

Joshua R. Disbrow has been employed by us since December, 2012. Prior to joining Ampio, he served as the Vice President of Commercial Operations at Arbor Pharmaceuticals, a specialty pharmaceutical company, from May 2007 through October 2012. He joined Arbor as that company's second full-time employee. Josh led the company's commercial efforts from inception to the company's acquisition in 2010 and growth to over \$127 million in net sales in 2011. By the time Mr. Disbrow departed Arbor in late 2012, he had led the growth of the commercial organization to comprise over 150 people in sales, marketing sales training, managed care, national accounts, and other commercial functions. Mr. Disbrow has spent over 17 years in the pharmaceutical, diagnostic and medical device industries and has held positions of increasing responsibility in sales,

marketing, sales management, commercial operations and commercial strategy. Prior to joining Arbor, Mr. Disbrow served as Regional Sales Manager with Cyberonics, Inc., a medical device company focused on neuromodulation therapies from June 2005 through April 2007. Prior to joining Cyberonics he was the Director of Marketing at LipoScience, an in vitro diagnostics company. He is the Chief Executive Officer of Luoxis Diagnostics, Inc. Mr. Disbrow holds an MBA from Wake Forest University and BS in Management from North Carolina State University.

- (2) Member of our Compensation Committee
- (3) Member of our Nominating and Governance Committee

Family Relationships

There are no family relationships between any of our directors. Raphael Bar-Or, a non-executive officer, is the son of David Bar-Or, our chief scientific officer and a director. Rick Giles, a former non-executive employee, is the son of Richard B. Giles, one of our directors. Jarrett Disbrow, the president and chief executive officer of Vyrrix, is the brother of Joshua R. Disbrow, our chief operating officer and chief executive officer of Luoxis.

Section 16(a) Beneficial Ownership Reporting Compliance

Section 16(a) of the Exchange Act requires our executive officers, directors and persons who beneficially own greater than 10% of our Common Stock to file certain reports, Forms 3, 4 and 5, with the SEC with respect to ownership and changes in ownership of our Common Stock. To our knowledge, no shareholder beneficially owns more than 10% of our Common Stock. Based solely on our review of Forms 3, 4 and 5, Vaughan Clift, our Chief Regulatory Affairs Officer, was delinquent in filing a Form 4 reporting the transfer by his wife in February 2014 of shares of our Common Stock to a managed Limited Liability Company over which neither Dr. Clift nor his wife has or possesses any control. Dr. Clift filed a Form 5 reporting such transfer in February 2015 and disclaims any beneficial ownership with respect to such shares.

Code of Business Conduct and Ethics

We have adopted a code of business conduct and ethics that is applicable to all of our employees, officers and directors. The code is available on our web site, www.ampiopharma.com, under the Investor Relations tab. We intend to disclose future amendments to, or waivers from, certain provisions of our code of ethics, if any, on the above website within four business days following the date of such amendment or waiver.

Meetings

During the year ended December 31, 2014, there were held (i) four meetings of the Board of Directors, (ii) six meetings of the Audit Committee, (iii) fifteen meetings of the Compensation Committee, and (iv) no meetings of the Nominating and Governance Committee. No incumbent director attended fewer than seventy-five percent (75%) of the aggregate of (1) the total number of meetings of the Board, and (2) the total number of meetings held by all committees of the Board during the period that such director served.

Table of Contents

Annual Meeting Attendance, Executive Sessions and Shareholder Communications

Commencing January 2011, our policy has been that directors attend the annual meeting of stockholders. We previously did not have a policy concerning director attendance at annual meetings. Commencing January 2011, our policy has been that our non-employee directors are also required to meet in separate sessions without management on a regularly scheduled basis four times a year. Generally, these meetings are expected to take place in conjunction with regularly scheduled meetings of the Board throughout the year in conjunction with committee meetings.

We have not implemented a formal policy or procedure by which our shareholders can communicate directly with our Board of Directors. Nevertheless, every effort has been made to ensure that the views of shareholders are heard by the Board of Directors or individual directors, as applicable, and that appropriate responses are provided to shareholders in a timely manner. We believe that we are responsive to shareholder communications, and therefore have not considered it necessary to adopt a formal process for shareholder communications with our Board. During the upcoming year, our Board will continue to monitor whether it would be appropriate to adopt such a policy. Communications will be distributed to the Board, or to any individual director or directors as appropriate, depending on the facts and circumstances outlined in the communications. Items that are unrelated to the duties and responsibilities of the Board may be excluded, such as:

junk mail and mass mailings

resumes and other forms of job inquiries

surveys

solicitations or advertisements.

In addition, any material that is unduly hostile, threatening, or illegal in nature may be excluded, provided that any communication that is excluded will be made available to any outside director upon request.

Involvement in Certain Legal Proceedings

No director, executive officer, promoter or control person of our Company has, during the last ten years: (i) been convicted in or is currently subject to a pending a criminal proceeding (excluding traffic violations and other minor offenses); (ii) been a party to a civil proceeding of a judicial or administrative body of competent jurisdiction and as a result of such proceeding was or is subject to a judgment, decree or final order enjoining future violations of, or prohibiting or mandating activities subject to any Federal or state securities or banking or commodities laws including, without limitation, in any way limiting involvement in any business activity, or finding any violation with respect to such law, nor (iii) any bankruptcy petition been filed by or against the business of which such person was an executive officer or a general partner, whether at the time of the bankruptcy or for the two years prior thereto.

We are not engaged in, nor are we aware of any pending or threatened, litigation in which any of our directors, executive officers, affiliates or owner of more than 5% of our common stock is a party adverse to us or has a material interest adverse to us.

Leadership Structure of the Board

The Board of Directors does not currently have a policy on whether the same person should serve as both the chief executive officer and chairman of the board or, if the roles are separate, whether the chairman should be selected from the non-employee directors or should be an employee. The Board believes that it should have the flexibility to make these determinations at any given point in time in the way that it believes best to provide appropriate leadership for us at that time. Our current chairman, Michael Macaluso, was appointed our chief executive officer effective January 2012. Mr. Macaluso has served as a member of our Board since March 2010, and has been a member of the Board of Directors of Life Sciences from December 2009.

Risk Oversight

The Board oversees risk management directly and through its committees associated with their respective subject matter areas. Generally, the Board oversees risks that may affect our business as a whole, including operational matters. The Audit Committee is responsible for oversight of our accounting and financial reporting processes and also discusses with management our financial statements, internal controls and other accounting and related matters. The Compensation Committee oversees certain risks related to compensation programs and the Nominating and Governance Committee oversees certain corporate governance risks. As part of their roles in overseeing risk management, these committees periodically report to the Board regarding briefings provided by management and advisors as well as the committees' own analysis and conclusions regarding certain risks faced by us. Management is responsible for implementing the risk management strategy and developing policies, controls, processes and procedures to identify and manage risks.

Table of Contents

Board Committees

Our Board of Directors has an Audit Committee, a Compensation Committee and a Nominating and Governance Committee, each of which has the composition and the responsibilities described below. The Audit Committee, Compensation Committee and Nominating and Governance Committee all operate under charters approved by our Board of Directors, which charters are available on our website.

Audit Committee. Our Audit Committee oversees our corporate accounting and financial reporting process and assists the Board of Directors in monitoring our financial systems and our legal and regulatory compliance. Our Audit Committee is responsible for, among other things:

selecting and hiring our independent auditors;

appointing, compensating and overseeing the work of our independent auditors;

approving engagements of the independent auditors to render any audit or permissible non-audit services;

reviewing the qualifications and independence of the independent auditors;

monitoring the rotation of partners of the independent auditors on our engagement team as required by law;

reviewing our financial statements and reviewing our critical accounting policies and estimates;

reviewing the adequacy and effectiveness of our internal controls over financial reporting; and

reviewing and discussing with management and the independent auditors the results of our annual audit, our quarterly financial statements and our publicly filed reports.

The members of our Audit Committee are Messrs. Giles, Coelho and Stevens. Mr. Giles is our Audit Committee chairman and was appointed to our Audit Committee in August 2010. Our Board of Directors has determined that each member of the Audit Committee meets the financial literacy requirements of the national securities exchanges and the SEC, and Mr. Giles qualifies as our Audit Committee financial expert as defined under SEC rules and regulations. Our Board of Directors has concluded that the composition of our Audit Committee meets the requirements for independence under the current requirements of the NYSE MKT and SEC rules and regulations. We believe that the functioning of our Audit Committee complies with the applicable requirements of SEC rules and regulations, and applicable requirements of the NYSE MKT.

Compensation Committee. Our Compensation Committee oversees our corporate compensation policies, plans and programs. The Compensation Committee is responsible for, among other things:

reviewing and recommending policies, plans and programs relating to compensation and benefits of our directors, officers and employees;

reviewing and recommending compensation and the corporate goals and objectives relevant to compensation of our chief executive officer;

reviewing and approving compensation and corporate goals and objectives relevant to compensation for executive officers other than our chief executive officer;

evaluating the performance of our executive officers in light of established goals and objectives;

developing in consultation with our Board of Directors and periodically reviewing a succession plan for our chief executive officer; and

administering our equity compensations plans for our employees and directors.

The members of our Compensation Committee are Messrs. Coelho, Giles and Stevens. Mr. Coelho is the chairman of our Compensation Committee. Each member of our Compensation Committee is a non-employee director, as defined in Rule 16b-3 promulgated under the Securities Exchange Act of 1934, as amended, is an outside director, as defined pursuant to Section 162(m) of the Internal Revenue Code of 1986, as amended, or the IRC, and satisfies the independence requirements of the NYSE MKT. We believe that the composition of our Compensation Committee meets the requirements for independence under, and the functioning of our Compensation Committee complies with, any applicable requirements of the NYSE MKT and SEC rules and regulations.

Our Compensation Committee and our Board of Directors have not yet established a succession plan for our chief executive officer.

In fulfilling its responsibilities, the Committee is permitted under the Compensation Committee charter to delegate any or all of its responsibilities to a subcommittee comprised of members of the Compensation Committee or the Board, except that the Committee may not delegate its responsibilities for any matters that involve compensation of any officer or any matters where it has determined such compensation is intended to comply with Section 162(m) of the Code or is intended to be exempt from Section 16(b) under the Exchange Act pursuant to Rule 16b-3 by virtue of being approved by a committee of independent or nonemployee directors.

Table of Contents

Nominating and Governance Committee. Our Nominating and Governance Committee oversees and assists our Board of Directors in reviewing and recommending corporate governance policies and nominees for election to our Board of Directors. The Nominating and Governance Committee is responsible for, among other things:

evaluating and making recommendations regarding the organization and governance of the Board of Directors and its committees;

assessing the performance of members of the Board of Directors and making recommendations regarding committee and chair assignments;

recommending desired qualifications for Board of Directors membership and conducting searches for potential members of the Board of Directors; and

reviewing and making recommendations with regard to our corporate governance guidelines.

The members of our Nominating and Governance Committee are currently Messrs. Giles and Coelho. Mr. Coelho is the chairman of our Nominating and Governance Committee. Our Board of Directors has determined that each member of our Nominating and Governance Committee is independent within the meaning of the independent director guidelines of the NYSE MKT.

Our Board of Directors may from time to time establish other committees.

Non-Employee Director Compensation

Our Compensation Committee established the following fees for payment to members of our Board of Directors or committees, as the case may be for the fiscal year ended December 31, 2014:

	Committee or Committees	Cash Compensation	Common Stock
Board Annual Retainer:			
Chairman		\$ 20,000	
Each non-employee director		10,000	
Board Meeting Fees:			
Each meeting attended in-person		\$ 1,000	
Each meeting attended telephonically or via web		500	
Committee Annual Retainer:			
Chairman of each committee	Audit; Compensation; Nominating and Governance	\$ 20,000	
Each non-chair member	Audit	12,000	
Each non-chair member	Compensation; Nominating and Governance	10,000	

Committee Chairman Meeting Fees:

Each meeting attended in-person	Audit; Compensation; Nominating and Governance	\$ 2,500
Each meeting attended telephonically or via web	Audit; Compensation; Nominating and Governance	1,500

Committee Member Meeting Fees:

Each meeting attended in-person	Audit; Compensation; Nominating and Governance	\$ 1,500
Each meeting attended telephonically or via web	Audit; Compensation; Nominating and Governance	1,000

Annual Stock Award: \$ 10,000

In December 2014, the Compensation Committee amended the Non-Employee Director Compensation for fiscal 2015 by increasing Board meeting fees for in-person attendance from \$1,000 to \$1,500 and telephonically attending from \$500 to \$1,000.

Table of Contents**Director Compensation for 2014**

The table below summarizes the compensation paid by us to non-employee directors for the year ended December 31, 2014. Our employee directors do not receive additional compensation for their services as a member of our Board of Directors.

Name	Fees Earned or Paid in Cash	Stock Option Awards (1)(2)	All Other Compensation (3)	Total
Philip H. Coelho	\$ 97,500	\$ 133,120	\$ 10,000	\$ 240,620
Richard B. Giles	\$ 84,000	\$ 306,383	\$ 10,000	\$ 400,383
David Stevens, PhD	\$ 61,000		\$ 10,000	\$ 71,000

- (1) In June 2014, Mr. Giles was granted an option to purchase 70,000 shares of common stock. This option has an exercise price of \$6.96 per share, which was the closing price of the Company's common stock on the date of grant (June 8, 2014). In December 2014, Mr. Coelho was granted an option to purchase 50,000 shares of common stock. This option has an exercise price of \$3.46 per share, which was the closing price of the Company's common stock on the date of grant (December 20, 2014). These options fully vested as of the grant date and have a term of 10 years from the grant date. The amounts in this column reflect the grant date fair values of the stock awards based on the last reported sale price of the common stock at the dates of grant. Please see Item 15 of Part IV, Notes to Consolidated Financial Statements Note 10 Equity Instruments.
- (2) At December 31, 2014, Messrs. Coelho, Giles and Dr. Stevens held options to acquire 565,554, 650,000 and 225,000 shares of common stock, respectively.
- (3) Annual stock award. In January 2014, each of Messrs. Coelho, Giles and Dr. Stevens was awarded 1,403 shares of common stock pursuant to the 2010 Plan, at a price of \$7.13 per share equivalent to \$10,000, which was the closing price of the Company's common stock on the date of grant (January 2, 2014).

Item 11. *Executive Compensation*
Executive Compensation

Compensation Discussion and Analysis

Overview. The following Compensation Discussion and Analysis describes the material elements of compensation for our executives identified in the Summary Compensation Table (Named Executive Officers). The Compensation Committee of the Board of Directors assists the Board of Directors in discharging the Board's responsibilities regarding compensation of our executives, including the Named Executive Officers. In particular, the Compensation Committee makes recommendations to the Board of Directors regarding the corporate goals and objectives relevant to executive compensation, evaluates executives' performance in light of such goals and objectives, and recommends the executives' compensation levels to the Board of Directors based on such evaluations. The Compensation Committee's recommendations relating to compensation matters are subject to approval by the Board.

Compensation Philosophy and Objectives. Our executive compensation program is designed to retain our executive officers and to motivate them to increase stockholder value on both an annual and longer term basis. These objectives

are to be accomplished primarily by positioning us to maximize our product development efforts and to transform, over time, those efforts into collaboration revenues and income. To that end, compensation packages include significant incentive forms of stock-based compensation to ensure that each executive officer's interest is aligned with the interests of our stockholders.

Named Executive Officers

For our most recently completed fiscal year (the year ended December 31, 2014), our Named Executive Officers were: (i) Michael Macaluso, our Chief Executive Officer, who has served as our Chief Executive Officer since January 2012, (ii) Mark D. McGregor, our former Chief Financial Officer, who served as our Chief Financial Officer from April 2011 until June 2014, (iii) Gregory A. Gould, our current Chief Financial Officer, who has served as our Chief Financial officer since June 2014, (iv) David Bar-Or, M.D., our current Chief Scientific Officer, who has served as our Chief Scientific Officer since March 2010, (v) Vaughan Clift, our current Chief Regulatory Affairs Officer, who has served as our Chief Regulatory Affairs Officer since March 2010, and (vi) Joshua Disbrow, our current Chief Operating Officer, who has served as our Chief Operating Officer since December 2012. We had no other executive officers serving during the year ended December 31, 2014.

Executive Compensation Components

Our compensation program for our Named Executive Officers consists of three components: (i) a base salary, (ii) discretionary bonuses based on performance, and (iii) equity compensation. Each of these components is reflected in the Summary Compensation Table below.

Table of Contents

Salaries. The initial cash salaries paid to Messrs. Macaluso, Gould, Disbrow and Drs. Bar-Or and Clift were established at the time they became officers. Each of these persons has an employment agreement with us, a copy of which is an exhibit to, or incorporated by reference herein. Mr. McGregor was an at-will employee and did not have an employment agreement with us. Since the respective dates of their becoming Named Executive Officers, any increases in the salaries of our Named Executive Officers have been made at the discretion of the Compensation Committee. Mr. Macaluso and Dr. Bar-Or receive no additional compensation for serving on our Board of Directors.

Cash Incentive Compensation. Cash incentive or bonus compensation is discretionary under our employment agreements with Drs. Bar-Or and Clift and Messrs. Macaluso, Gould and Disbrow. However, each employment agreement contains performance objectives tailored to the individual officer's duties, and Company performance. All cash incentive compensation grants are intended to be paid in accordance with Section 162(m) of the Code. For 2014, we awarded a cash bonus to Mr. Macaluso of \$5,000, to Dr. Bar-Or of \$5,000, to Dr. Clift of \$5,000, to Mr. Gould of \$5,000 and to Mr. Disbrow of \$180,000 which were awarded on a discretionary basis by the Compensation Committee based on the Compensation Committee's assessment of 2014 performance, of Mr. Disbrow's \$180,000, \$175,000 was related to his superior performance as Chief Executive Officer of Luoxis. We also paid Mr. Gould \$22,000 in accordance with his relocation to Colorado.

Equity Compensation. In 2014, we granted stock options to certain of our officers, directors and consultants for their services, all of which were granted pursuant to written agreements under the 2010 Plan. All future grants are expected to be made under the 2010 Plan. The vesting period for option grants vary.

Perquisites. We offer health benefits for all of our employees. None of our Named Executive Officers receives any further perquisites.

Why Each Element of Compensation is Paid; How the Amount of Each Element is Determined. The Compensation Committee intends to pay each of these elements in order to ensure that a desirable overall mix is established between base compensation and incentive compensation, cash and non-cash compensation, and annual and long-term compensation. The Compensation Committee also intends to evaluate on a periodic basis the overall competitiveness of our executive compensation packages as compared to packages offered in the marketplace for which we compete with executive talent. Overall, our Compensation Committee believes that our executive compensation packages are currently appropriately balanced and structured to retain and motivate our Named Executive Officers, while necessarily taking into account our presently limited financial resources.

How Each Compensation Element Fits into Overall Compensation Objectives and Affects Decisions Regarding Other Elements. In establishing compensation packages for executive officers, numerous factors are considered, including the particular executive's experience, expertise and performance, our operational and financial performance as a Company, and compensation packages available in the marketplace for similar positions. In arriving at amounts for each component of compensation, our Compensation Committee strives to strike an appropriate balance between base compensation and incentive compensation. The Compensation Committee also endeavors to properly allocate between cash and non-cash compensation and between annual and long-term compensation.

Risk Assessment. Our Compensation Committee has reviewed our compensation program and believes that the program, including our cash incentive compensation and equity incentive compensation, does not encourage our Named Executive Officers to engage in any unnecessary or excessive risk-taking. As a result, the Compensation Committee has to date not implemented a provision for recovery by us of cash or incentive compensation bonuses paid to our Named Executive Officers.

Role of Compensation Consultants in Executive Compensation Decisions. The Compensation Committee has the authority to retain the services of third-party executive compensation specialists in connection with the establishment of the Company's compensation policies. The Compensation Committee did not use a compensation consultant in connection with setting 2014 executive compensation, and relied upon the professional and market experience of the Committee members in determining 2014 executive compensation. The Compensation Committee may engage a compensation consultant in the future if it deems such services to be appropriate and cost-justified.

Role of Executives in Executive Compensation Decisions. The Compensation Committee seeks input and specific recommendations from our Chief Executive Officer when discussing the performance of, and compensation levels for, executives other than himself. The Chief Executive Officer provides recommendations to the Compensation Committee regarding each executive officer's level of individual achievement other than himself. However, he is not a member of the Compensation Committee and does not vote. The Compensation Committee also works with our Chief Executive Officer and our Chief Financial Officer to evaluate the financial, accounting, tax and retention implications of our various compensation programs. Neither our Chief Executive Officer nor any of our other executives participates in deliberations relating to his or her own compensation.

Table of Contents

Tax and Accounting Implications

Deductibility of Executive Compensation. Section 162(m) of the Internal Revenue Code limits the tax deduction to \$1 million for compensation paid to certain executives of public companies. However, performance-based compensation that has been approved by stockholders is not subject to the \$1 million limit under Section 162(m) if, among other requirements, the compensation is payable only upon attainment of pre-established, objective performance goals, and the Board of Directors committee that establishes such goals consists only of outside directors. All members of the Compensation Committee qualify as outside directors. Additionally, stock options will qualify for the performance-based exception where, among other requirements, the exercise price of the option is not less than the fair market value of the stock on the date of the grant, and the plan includes a per-executive limitation on the number of shares for which options may be granted during a specified period.

Compensation Committee Interlocks and Insider Participation

None of the members of our Compensation Committee is an officer or employee of our Company. None of our executive officers currently serves, or in the past year has served, as a member of the Board of Directors or Compensation Committee of any entity that has one or more executive officers serving on our Board of Directors or Compensation Committee.

Compensation Committee Report

The Compensation Committee of the Board of Directors has reviewed and discussed the Compensation Discussion and Analysis required by Item 402(b) of Regulation S-K with management and, based on such review and discussions, the Compensation Committee recommended to the Board of Directors that the Compensation Discussion and Analysis be included in this Annual Report on Form 10-K and in the Company's Proxy Statement.

Submitted by the Compensation Committee of
the Board of Directors

Philip H. Coelho
Richard B. Giles

David R. Stevens, Ph.D.

Table of Contents

The following table sets forth all cash compensation earned, as well as certain other compensation paid or accrued in 2014, 2013 and 2012, to each of the following named executive officers.

Summary Compensation of Named Executive Officers

Name and Principal Position (a)	Year (b)	Salary (\$) (c)	Bonus (\$) (d)	Stock Award (\$) (e)	Option Award Compensation (\$) (f)	Change in Pension Value and Non-Equity Incentive Compensation (\$)	Deferred Compensation (\$)	Other Compensation (\$)	Total (\$) (j)

- (1) Unexercisable options vest monthly and become fully vested May 7, 2015.
(2) Unexercisable option vests annually and becomes fully vested December 15, 2015.
(3) Unexercisable option vests annually and becomes fully vested July 31, 2015.
(4) Unexercisable option vests annually and becomes fully vested June 10, 2016.
(5) Unexercisable options vest annually and become fully vested January 1, 2017.

Table of Contents**Employment Agreements**

In August 2010, we entered into employment agreements with Dr. David Bar-Or, our Chief Scientific Officer, and Dr. Vaughan Clift, our Chief Regulatory Affairs Officer. The employment agreement with Dr. Bar-Or supersedes his prior agreement with Life Sciences. Dr. Clift's employment agreement was amended on October 1, 2010 and May 26, 2011. The terms of the employment agreements with Dr. Bar-Or and Dr. Clift are substantially identical except as noted below. Each agreement had an initial term ending July 31, 2013. The agreements provide for annual salaries of \$300,000 for Dr. Bar-Or, and \$250,000 for Dr. Clift. On July 15, 2013, Ampio extended the Employment Agreements of Dr. David Bar-Or and Dr. Vaughan Clift for one additional year, expiring July 31, 2014. In connection with these Amendments, Dr. Bar-Or and Dr. Clift were awarded 300,000 and 170,000 options, respectively, for Ampio common stock at an exercise price of \$6.15 with 50% vesting upon grant and 50% after one year. On August 11, 2014, Ampio extended the Employment Agreements of Dr. David Bar-Or and Dr. Vaughan Clift for one additional year, expiring July 31, 2015. In connection with these Amendments, Dr. Bar-Or and Dr. Clift were awarded 300,000 and 170,000 options, respectively, for Ampio common stock at an exercise price of \$6.48 with 50% vesting upon grant and 50% after one year. We entered into an employment agreement with Mr. Michael Macaluso, our Chief Executive Officer, effective January 9, 2012 which provided for an annual salary of \$195,000, with an initial term ending January 9, 2015. On October 1, 2013, Ampio increased Mr. Macaluso's annual salary from \$195,000 to \$300,000. On December 20, 2014, Ampio extended the Employment Agreement of Mr. Macaluso for three additional years, expiring January 9, 2017. In connection with this Amendment, Mr. Macaluso was awarded 400,000 options for Ampio common stock at an exercise price of \$3.46 vesting annually over three years beginning on January 1, 2015. We entered into an employment agreement with Mr. Joshua Disbrow, our Chief Operating Officer, effective December 15, 2012. This agreement has an initial term ending December 15, 2015 and provides for an annual salary of \$210,000. Mr. Disbrow also receives an annual salary of \$35,000 from Luoxis effective June 16, 2013. We entered into an employment agreement with Mr. Gregory Gould, our Chief Financial Officer, on June 10, 2014, which provided for an annual salary of \$250,000, with an initial term ending June 10, 2017. In connection with this employment agreement, Mr. Gould was awarded 300,000 options for Ampio common stock at an exercise price of \$7.14 vesting annually over two years beginning on June 10, 2014.

Each officer is eligible to receive a discretionary annual bonus each year that will be determined by the Compensation Committee of the Board of Directors based on individual achievement and Company performance objectives established by the Compensation Committee. Included in those objectives, as applicable for the responsible officer, are (i) obtaining successful phase II and phase III clinical trial results, (ii) preparation and compliance with a fiscal budget, (iii) the launch of clinical trials for additional products approved by the Board of Directors, (iv) the sale of intellectual property not selected for clinical trials by the Company at prices, and times, approved by the Board of Directors and (v) making significant scientific discoveries acceptable to the Board of Directors. The targeted amount of each officer's annual bonus shall be 50% of the applicable base salary, although the actual bonus may be higher or lower.

The employment agreements for Dr. Bar-Or and Dr. Clift provided for an initial grant of stock options in the amount of 700,000 (subsequently reduced to 400,000) and 365,000 options, respectively. Each option is exercisable for a period of ten years at an exercise price per share equal to the quoted closing price of our common stock on August 11, 2010. Mr. Disbrow was granted 450,000 (subsequently reduced to 400,000) stock options which vest as follows: (i) 88,880 options to purchase common stock vested on the grant date of December 15, 2012; (ii) 88,880 options to purchase common stock vest 365 days after the grant date; (iii) 111,120 options to purchase common stock vest 730 days after the grant date; and (iv) 111,120 options to purchase common stock vest 1,095 days after the grant date; and are exercisable for a period of ten years at an exercise price per share equal to the quoted closing price of our common stock on December 14, 2012. In the event of a change in control or in the event of termination without cause or for good reason (as such terms are defined in the employment agreement), all outstanding stock options held by

Mr. Disbrow will become fully vested and exercisable.

Potential Payments upon Termination or Change in Control

If the employment of Mr. Disbrow, Mr. Gould, Dr. Bar-Or, or Dr. Clift is terminated at our election at any time, for reasons other than death, disability or cause (as defined in the employment agreements), or if an officer terminates his employment for good reason (as defined in the employment agreements), the officer in question shall be entitled to receive a lump sum severance payment equal to two times his base salary and of the continued payment of premiums for continuation of the officer's health and welfare benefits pursuant to COBRA or otherwise, for a period of two years from the date of termination, subject to earlier discontinuation if the officer is eligible for comparable coverage from a subsequent employer. Mr. Macaluso is not entitled to any such termination payments pursuant to the terms of his employment agreement. All severance payments, less applicable withholding, are subject to the officer's execution and delivery of a general release of us and our subsidiaries and affiliates and each of their officers, directors, employees, agents, successors and assigns in a form acceptable to us, and a reaffirmation of the officer's continuing obligation under the propriety information and inventions agreement (or an agreement without that title, but which pertains to the officer's obligations generally, without limitation, to maintain and keep confidential all of our proprietary and confidential information, and to assign all inventions made by the officer to us, which inventions are made or conceived during the officer's employment). If the employment is terminated for cause, no severance shall be payable by us.

Table of Contents

Good Reason means:

a material reduction or change in the officer's title or job duties inconsistent with his position and his prior duties, responsibilities and requirements;

any reduction of the officer's then-current base salary or his target bonus;

relocation of the officer to a facility or location more than 30 miles from our current offices in Greenwood Village, Colorado; or

a material breach by Ampio of the employment agreement.

Cause means:

conviction of a felony or a crime involving fraud or moral turpitude;

commission of theft, a material act of dishonesty or fraud, intentional falsification of employment or Company records, or a criminal act that impairs the officer's ability to perform his duties;

intentional or reckless conduct or gross negligence materially harmful to Ampio or its successor;

willful failure to follow lawful instructions of the Board; or

gross negligence or willful misconduct in the performance of duties.

Change in Control means: the occurrence of any of the following events:

Any person (other than persons who are employees of Ampio at any time more than one year before a transaction) becomes the beneficial owner, directly or indirectly, of securities of Ampio representing 50% or more of the combined voting power of Ampio's then outstanding securities. In applying the preceding sentence, (A) securities acquired directly from Ampio or its affiliates by or for the person shall not be taken into account, and (B) an agreement to vote securities shall be disregarded unless its ultimate purpose is to cause what would otherwise be Change in Control, as reasonably determined by the Board;

Ampio consummates a merger, or consolidation of Ampio with any other corporation unless: (a) the voting securities of Ampio outstanding immediately before the merger or consolidation would continue to represent

(either by remaining outstanding or by being converted into voting securities of the surviving entity) at least 50% of the combined voting power of the voting securities of Ampio or such surviving entity outstanding immediately after such merger or consolidation; and (b) no person (other than persons who are employees at any time more than one year before a transaction) becomes a beneficial owner, directly or indirectly, of securities of Ampio representing 50% or more of the combined voting power of Ampio's then outstanding securities;

The stockholders of Ampio approve an agreement for the sale or disposition by Ampio of all, or substantially all, of Ampio's assets; or

The stockholders of Ampio approve a plan or proposal for liquidation or dissolution of Ampio.

In the event of a Change of Control, all outstanding stock options, restricted stock and other stock-based grants held by Mr. Macaluso, Mr. Disbrow, Mr. Gould, Dr. Bar-Or and Dr. Clift become fully vested and exercisable, and all such stock options remain exercisable from the date of the Change in Control until the expiration of the term of such stock options.

Notwithstanding the foregoing, a Change in Control shall not be deemed to have occurred by virtue of the consummation of any transaction or series of integrated transactions immediately following which the record holders of the common stock of Ampio immediately prior to such transaction or series of transactions continue to have substantially the same proportionate ownership in an entity which owns all or substantially all of the assets of Ampio immediately following such transaction or series of transactions.

Table of Contents

The employment agreements do not provide for the payment of a gross-up payment under Section 280G of the Internal Revenue Code. In addition, in accordance with Ampio's stock incentive plan, all outstanding stock options held by Mr. Disbrow, Mr. Gould, Dr. Bar-Or and Dr. Clift (and all other option holders with grants under that plan) become fully vested in connection with a Change in Control. All outstanding stock options held by Mr. Macaluso will also become fully vested in connection with a Change in Control. The following table provides estimates of the potential severance and other post-termination benefits that each of Dr. Bar-Or, Dr. Clift, Mr. Disbrow, Mr. Macaluso, and Mr. Gould would have been entitled to receive assuming their respective employment was terminated as of December 31, 2014 for the reason set forth in each of the columns.

Recipient and Benefit	Cause; Without good reason	Without Cause; Good reason	Death	Disability	Change in Control
David Bar-Or, M.D.					
Salary		\$ 600,000			
Stock Options (4)					
Value of health benefits provided after termination (1)					41,457
